System Design (ACSD'05), July 2007, Bratislava.

Automata-Theoretic Approach to Model Checking

Automata-Theoretic Approach to Model Checking

Transition-based Generalized Büchi Automata

An infinite run of this automaton is accepting if it visits a transition from each accepting condition (\bullet , \circ , ...) infinitely often.

Emptiness Check = Does an automaton have no accepting run?
 \implies Search for an accepting cycle reachable from the initial state.

Transition-based Generalized Büchi Automata

An infinite run of this automaton is accepting if it visits a transition from each accepting condition (\bullet, \circ, \dots) infinitely often.

Emptiness Check = Does an automaton have no accepting run?
 \implies Search for an accepting cycle reachable from the initial state.

Emptiness Checks

| | degeneralized (one acceptance condition) | generalized (m acceptance conditions) |
|------------|--|--|
| Nested DFS | DFS for acc. transitions + Nested DFS to find cycle <ul style="list-style-type: none">• 2 bits per state• immediate counterexamples• require degeneralization (size $\times m$)• slow | DFS for acc. transitions + several Nested DFS <ul style="list-style-type: none">• $\log_2(m + 1)$ bits per state• visit states several times• slow |
| SCC | (pointless) | Compute SCCs on the fly, abort on accepting SCC <ul style="list-style-type: none">• fastest• visit states once• indifferent to m• SCC information useful• one integer per state |

Found!

State space reduction using symmetries:

- Global Symmetries
(e.g., client/server system with many identical clients)

- Partial Symmetries [Haddad, Ilié, Ajami: FORTE'00]
(e.g., two clients have different access priorities to the server)

State space reduction using symmetries:

- Global Symmetries
(e.g., client/server system with many identical clients)
 - Define equivalence classes of states.
 - Reduction straightforward.
 - But globally symmetric state spaces are uncommon.
- Partial Symmetries [Haddad, Ilié, Ajami: FORTE'00]
(e.g., two clients have different access priorities to the server)

Generalization, from the Emptiness Check POV

Any method that can construct such a (B) instead of (A) so that

- $\forall s \xrightarrow{\text{green}} s', \forall S \ni s, \exists S' \ni s'$ such that $S \xrightarrow{\text{green}} S'$
- $\forall S \xrightarrow{\text{green}} S', \forall s' \in S', \exists s \in S$ such that $s \xrightarrow{\text{green}} s'$

will guarantee emptiness check equivalence

$$\text{Acc}(\mathcal{A}) = \emptyset \iff \text{Acc}(\mathcal{B}) = \emptyset$$

Inclusion and Dead States

$$S \supseteq S' \implies \left(\text{Acc}(\mathcal{B}[S]) = \emptyset \implies \text{Acc}(\mathcal{B}[S']) = \emptyset \right)$$

Inclusion and Search Stack States

Inclusion and Search Stack States

Inclusion and Search Stack States

- Directs the on-the-fly construction of the state space.
- Explicitly a loop in the stack: good to abort early
- Tries to reuse existing states: a heuristic attempt to fight $2^{|\mathcal{A}|}$

Summary and Perspectives

Requirements:

- A representation of $\begin{pmatrix} s_1 & \bullet & \bullet & s_2 \\ s_3 & \bullet & \bullet & s_4 \end{pmatrix}$ smaller than that of $\begin{pmatrix} s_1 & \bullet & \bullet & s_2 \\ s_3 & \bullet & \bullet & s_4 \end{pmatrix}$
- A construction that guarantees
 - $\forall s \xrightarrow{\bullet} s', \forall S \ni s, \exists S' \ni s'$ such that $S \xrightarrow{\bullet} S'$
 - $\forall S \xrightarrow{\bullet} S', \forall s' \in S', \exists s \in S$ such that $s \xrightarrow{\bullet} s'$
- A representation of states that allows inclusion checks
- Fast lookup of candidates for inclusion checks
- A decomposition operation (optional)

Summary and Perspectives

Requirements:

- A representation of $\begin{matrix} s_1 & \bullet & \bullet & s_2 \\ s_3 & \bullet & \bullet & s_4 \end{matrix}$ smaller than that of $\begin{matrix} s_1 & \bullet & \bullet & s_2 \\ s_3 & \bullet & \bullet & s_4 \end{matrix}$
- A construction that guarantees
 - $\forall s \xrightarrow{\bullet} s', \forall S \ni s, \exists S' \ni s'$ such that $S \xrightarrow{\bullet} S'$
 - $\forall S \xrightarrow{\bullet} S', \forall s' \in S', \exists s \in S$ such that $s \xrightarrow{\bullet} s'$
- A representation of states that allows inclusion checks
- Fast lookup of candidates for inclusion checks
- A decomposition operation (optional)

Two new emptiness checks:

- Correct, with inclusion in the stack
- Approximative, with the reverse inclusion

Summary and Perspectives

Requirements:

- A representation of $\begin{matrix} s_1 & \bullet & \bullet & s_2 \\ s_3 & \bullet & \bullet & s_4 \end{matrix}$ smaller than that of $\begin{matrix} s_1 & \bullet & \bullet & s_2 \\ s_3 & \bullet & \bullet & s_4 \end{matrix}$
- A construction that guarantees
 - $\forall s \xrightarrow{\bullet} s', \forall S \ni s, \exists S' \ni s'$ such that $S \xrightarrow{\bullet} S'$
 - $\forall S \xrightarrow{\bullet} S', \forall s' \in S', \exists s \in S$ such that $s \xrightarrow{\bullet} s'$
- A representation of states that allows inclusion checks
- Fast lookup of candidates for inclusion checks
- A decomposition operation (optional)

Two new emptiness checks:

- Correct, with inclusion in the stack
- Approximative, with the reverse inclusion

What next?

- Both inclusions could be combined.
- Investigate other state-space reductions with “set” states.
- Conditions probably too strong.

Summary and Perspectives

Requirements:

- A representation of $\begin{matrix} s_1 & \bullet & \bullet & s_2 \\ s_3 & \bullet & \bullet & s_4 \end{matrix}$ smaller than that of $\begin{matrix} s_1 & \bullet & \bullet & s_2 \\ s_3 & \bullet & \bullet & s_4 \end{matrix}$
