Testing

Performance

Conclusion

Thanks !

■ What is it ?

- ▶ An implementation of CLOS for XEmacs
- ▶ Including the Meta-Object Protocol (MOP)

■ What's in it ?

- ▶ A port of Closette to Emacs Lisp
- ▶ Deeper type/class integration
- ▶ A comprehensive test suite

■ About XEmacs

- ▶ Initially a fork of GNU Emacs v.19-to-be (1991)
- ▶ Greatly diverged since then
- ▶ User-level Emacs Lisp compatibility
- ▶ ~~Internals compatibility~~

■ About the internals

- ▶ Very high level of abstraction
- ▶ 111 opaque Lisp types, 35 user-level
- ▶ Core in “C+”: data-abstraction and OO infrastructure

A couple of “C+” examples

So why not use C++ directly ? *plonk*

CLIX

Conclusion

Thanks !

Polymorphism / Class-like abstraction

```
struct console
{
    enum console_variant    contype;
    void                    *console_data;
    struct console_methods *conmeths;
    /* ... */
}
```

Dynamic method lookup

```
MAYBE_CONMETH (console, mark_console, ...);
```

Motivation

Bring the same level of abstraction to the Lisp layer

The CL package

Scoping

λ -lists

Type/Class

Types

Generic Functions

Project status

Available Features

Testing

Performance

Conclusion

Thanks !

■ Why isn't it the case already ?

- ▶ GNU Emacs compatibility
- ▶ Emacs Lisp *backward* compatibility
- ▶ Less “OO pressure” at the Lisp level
 - Glue to the C level
 - Not the job of *package* authors
 - Requires more than the average coding skill
 - Ad-hoc abstraction easier to achieve in Lisp

■ What would be the benefits ?

- ▶ C-based features: abstract away the Lisp glue
- ▶ Lisp features: improve maintainability / extensibility
- ▶ Also for third-party packages (e.g. Gnus)

Why CLOS?

Arguments in favor of it

CLOX

Didier Verna

Introduction

Context

Motivation

Alternatives

Closette

ELisp vs. Lisp

The CL package

Scoping

λ -lists

Type/Class

Types

Generic Functions

Project status

Available Features

Testing

Performance

Conclusion

Thanks !

1 Emacs Lisp

- ▶ Close to MacLisp and Common Lisp
- ▶ Many developers familiar with Common Lisp
- ▶ CL package dependency: 16% files, 27% LoC

2 CLOS

- ▶ One of the most powerful object system around
- ▶ Well documented
- ▶ No need to start from scratch

3 Porting Common Lisp libraries to Emacs Lisp

4 Attract more Common Lisp developers

5 Gain expertise in CLOS and its MOP ; -)

Alternatives

Other available object systems

CLoX

The CL package

Scoping

λ -lists

Type/Class

Types

Generic Functions

Project status

Available Features

Testing

Performance

Conclusion

Thanks !

1 **EOOPS** (Emacs Lisp Object Oriented Programming System)

- ▶ Message passing (Smalltalk style)
- ▶ No activity since 1992
- ▶ No known Emacs Lisp package using it

2 **EIEIO** (Enhanced Implementation of Emacs Interpreted Objects)

- ▶ Active
- ▶ Part of the CEDET package (70,000 LoC)
- ▶ CLOS-like
- ▶ Additional features (*e.g.* debugging support)
- ▶ Doesn't aim at being *fully* compliant

Emacs Lisp vs. Common Lisp

All them dialects, they make my head swim

CLIX

Didier Verna

Introduction

Context

Motivation

Alternatives

Closette

ELisp vs. Lisp

The CL package

Scoping

λ -lists

Type/Class

Types

Generic Functions

Project status

Available Features

Testing

Performance

Conclusion

Thanks !

■ Fundamental differences

- ▶ Dynamic vs. lexical scope
- ▶ No package system, Limited λ -list syntax
- ▶ Different types, condition system, printing facilities *etc.*

■ Less obvious ones

- ▶ Different function names
- ▶ Similar functions with different semantics
- ▶ `function` is different

■ (X)Emacs Lisp evolution

- ▶ Self-evaluating keywords since 1996
- ▶ `#'` syntax since XEmacs 19.8
- ▶ Primitive `character` type since XEmacs 19.20
- ▶ Built-in multiple values since a couple of months

▶ XEmacs no later than 21.5 ~~beta-29~~ \today is required

The CL package

Common Lisp emulation layer

Motivation

Alternatives

Closette

ELisp vs. Lisp

The CL package

Scoping

λ -lists

Type/Class

Types

Generic Functions

Project status

Available Features

Testing

Performance

Conclusion

Thanks !

- Provide missing standard utility functions or macros
(*e.g.* `loop`)
- Extend existing but limited ones
(*e.g.* ~~`mapcar*`~~)
- Support full λ -list syntax
(`defun*`, `defmacro*` *etc.*)
- `typep`
- `setf` / `defsetf` (no `setf` functions)

Dynamic vs. lexical scope

Types
Generic Functions

Project status

Available Features
Testing
Performance

Conclusion

Thanks !

- CL's `lexical-let` to the rescue
- Not necessary in most cases
 - ▶ Local use of `let` bindings or function parameters
 - ▶ “Downward funargs” situations
 - ▶ “Upward funargs” situations in *some* cases

▶ Only 6 actual uses of `lexical-let`

Downward funargs: example

Look at the `required-classes` argument

CLIX

Didier Verna

Introduction

Context

Motivation

Alternatives

Closette

ELisp vs. Lisp

The CL package

Scoping

λ-lists

Type/Class

Types

Generic Functions

Project status

Available Features

Testing

Performance

Conclusion

Thanks !

```
(defun compute-applicable-methods-using-classes
  (gf required-classes)
  #/... /#
  (remove-if-not #'(lambda (method)
                     (every #'subclassp
                           required-classes
                           (method-specializers method))))
  (generic-function-methods gf))
#/... /#)
```

Upward funargs: example

Look at the `next-emfun` argument

CLIX

Didier Verna

Introduction

Context

Motivation

Alternatives

Closette

ELisp vs. Lisp

The CL package

Scoping

λ -lists

Type/Class

Types

Generic Functions

Project status

Available Features

Testing

Performance

Conclusion

Thanks !

```
(defun compute-primary-emfun (methods)
  (if (null methods)
      nil
```

;; Common Lisp version:

```
(let ((next-emfun (compute-primary-emfun (cdr methods))))
  #'(lambda (args)
      (funcall (method-function (car methods))
               args next-emfun)))
```

;; Partially evaluated Emacs Lisp version:

```
(let ((next-emfun (compute-primary-emfun (cdr methods))))
  '(lambda (args)
      (funcall (method-function ',(car methods))
               args ',next-emfun)))
```

Upward funargs: explanation

Look at the `next-emfun` argument

CLX

Didier Verna

Introduction

Context

Motivation

Alternatives

Closette

ELisp vs. Lisp

The CL package

Scoping

λ -lists

Type/Class

Types

Generic Functions

Project status

Available Features

Testing

Performance

Conclusion

Thanks !

;; Partially evaluated Emacs Lisp version:

```
(let ((next-emfun (compute-primary-emfun (cdr methods))))  
  `(lambda (args)  
    (funcall (method-function ', (car methods))  
             args ',next-emfun)))
```

- `lambda` is self-quoting
- `(lambda ...)` is a function designator
e.g. `(funcall '(lambda (x) x) 1)`
- `function` $\iff$ `quote` + `byte-compiler` hint
- **Note:** use `byte-compile` on the resulting form

Full blown λ -lists

Emacs Lisp restricted to `&optional` and `&rest`

CLIX

Didier Verna

Introduction

Context

Motivation

Alternatives

Closette

ELisp vs. Lisp

The CL package

Scoping

λ -lists

Type/Class

Types

Generic Functions

Project status

Available Features

Testing

Performance

Conclusion

Thanks !

- CL provides the rest (`defun*` *etc.*)
- What about generic functions and methods ?
 - ▶ CL provides `cl-transform-lambda`
 - ▶ Use it in our `compute-method-function`

λ -list transformation example

```
;; (lambda (a &optional (b 'b) &key (key1 'key1)) #/.../#)
(lambda (a &rest --rest--39249)
  (let* ((b (if --rest--39249 (pop --rest--39249) (quote b)))
        (key1 (car (cdr (or (memq :key1 --rest--39249)
                                (quote (nil key1)))))))
    (let ((--keys--39250 --rest--39249))
      (while --keys--39250
        (cond ((memq (car --keys--39250)
                     (quote (:key1 :allow-other-keys)))
              (setq --keys--39250 (cdr (cdr --keys--39250))))
              ((car (cdr (memq :allow-other-keys --rest--39249)))
               (setq --keys--39250 nil))
              (t
               (error "Keyword_argument_%s_not_one_of_(%key1)"
                      (car --keys--39250))))))
    #/.../#)))
```

Types

*ClO*X objects are vectors

*ClO*X

ELisp vs. Lisp

The CL package

Scoping

λ -lists

Type/Class

Types

Generic Functions

Project status

Available Features

Testing

Performance

Conclusion

Thanks !

■ Built-in types

- ▶ C level: integers, characters and `lrecord` types
- ▶ User level: corresponding type predicate Lisp function
- ▶ 30 LoC to filter them out

■ `type-of` doesn't work on *ClO*X objects

- ▶ Better not hide the *true* nature of Lisp objects
- ▶ Not required to make *ClO*X work
- ▶ Will work *eventually* (C level)

■ `typep` is provided by CL

- ▶ Need predicate functions:
 $(\text{typep } \text{obj } ' \text{my-type}) \iff (\text{my-type-p } \text{obj})$
 - ▶ `ensure-class` creates them
- ▶ Should work on class *objects*, not only *names*
 - ▶ *ClO*X-specific `defavice` around it

Generic functions specific problems

Generic function objects are funcallable in Common Lisp

CLX

Didier Verna

Introduction

Context

Motivation

Alternatives

Closette

ELisp vs. Lisp

The CL package

Scoping

λ -lists

Type/Class

Types

Generic Functions

Project status

Available Features

Testing

Performance

Conclusion

Thanks !

This is already working

```
(setq mygf (defgeneric gf #/.../#))  
(typep mygf 'some-gf-class)
```

- *CLX* generic functions are vectors
 - ▶ Not funcallable
 - ▶ $\neq$ discriminating function
- `function` $\approx$ `quote`
 - ▶ `function` **doesn't** return a functional value
 - ▶ `symbol-function` **does**

Solution

Handle all references to generic functions

CLIX

Didier Verna

find-generic-function*

- by name (symbol)
- by functional value
- by object (vector)

my-class-predicate-p

find-method

(defadvice)

functionp

This is now working

```
(typep (symbol-function 'gf) 'some-gf-class)  
(typep #'gf 'some-gf-class) ;; or just 'gf
```

This as well

```
(find-method (symbol-function 'gf) ;; ...  
(find-method #'gf ;; ... or just 'gf
```

And this

```
(typep (symbol-function 'gf) 'function)  
(typep #'gf 'function) ;; or just 'gf
```

One (major) drawback

Rock around the *ClOx*

Conclusion

Thanks !

- **Closette** (see section 1.1 of the AMOP)
 - ▶ Missing: class redefinition, non-standard method combinations, `eql` specializers and `:class` wide slots
- **And beyond**
 - ▶ `:method` option to `defgeneric`
 - ▶ **Aware of the others** `defgeneric` and slot options
 - ▶ `slot-unbound` protocol with emulated `unbound-slot-instance` and `cell-error-name`
 - ▶ **Extended** `slot-missing` protocol
 - ▶ **Topmost class hierarchy** (`class`, `built-in-class`, `function`, `generic-function` and `method`)
 - ▶ **Almost complete type/class integration**

... Compared to EIEIO

CLX

Didier Verna

Introduction

Motivation

Alternatives

Closette

ELisp vs. Lisp

The CL package

Scoping

λ -lists

Type/Class

Types

Generic Functions

Project status

Available Features

Testing

Performance

Conclusion

Thanks !

■ What's missing

- ▶ No underlying MOP
- ▶ No type/class integration
- ▶ No `:around` methods
- ▶ No `:method` option to `defgeneric` calls
- ▶ Buggy λ -list support
- ▶ Syntactic glitches

■ Additional bells'n whistles

- ▶ A class browser
- ▶ Automatic `TEXinfo` documentation
- ▶ `edebug` support
- ▶ Abstract classes, static methods, C++-like slot protection

Testing

GRR #1: it is better to be correct than to be fast

CLIX

Didier Verna

Introduction

Context

Motivation

Alternatives

Closette

ELisp vs. Lisp

The CL package

Scoping

λ -lists

Type/Class

Types

Generic Functions

Project status

Available Features

Testing

Performance

Conclusion

Thanks !

■ Why early testing ?

- ▶ No edebug support
- ▶ Limited printing facility (circular structures)
- ▶ gensym infestation

■ Paul Dietz's ANSI Common Lisp test suite

- ▶ 900 tests related to objects
- ▶ Ported to Emacs Lisp
- ▶ Corollary: `rt` package ported as well

■ Current status

- ▶ 50% of the tests pass
- ▶ 100% of the tests that pass are ok ;-)
- ▶ EIEIO: only 12%

Performance

GRR #2: it is better to be fast than to be slow (someday)

■ What we have

- ▶ An implementation of CLOS for Emacs Lisp
- ▶ A comprehensive test suite
- ▶ Corollary: an Emacs Lisp port of `rt`

■ Next steps

- ▶ Complete the feature set
- ▶ Improve performance (C-level integration)
- ▶ Port to GNU Emacs

■ Potential uses

- ▶ Core features (*e.g.* specifiers)
- ▶ User libraries (*e.g.* Gnus `*Hmp f ! *`)

Thanks !
