1 Introduction

`Declt` (pronounce “dec’let”) is a reference manual generator for Common Lisp libraries. A `Declt` manual documents one specified ASDF system (considered as the “main” system), and all its local dependencies (subsystems found in the same distribution). This is what is collectively referred to as the *library*.

`Declt` doesn’t perform any kind of static code analysis, but instead loads the library, and then introspects the Lisp environment to discover what “belongs” to it. The generated documentation includes the description of both programmatic and ASDF components. Every such component description is called a *definition*.

`Declt` manuals provide a detailed description of the library’s infrastructure by including definitions for every relevant ASDF component (systems, modules, and files), and Lisp package.

Exported programmatic definitions are split from the internal ones, which allows to separately browse either the library’s public interface or its implementation. Both sections of the manual include definitions for constants, special variables, symbol macros, macros, `setf` expanders, compiler macros, regular functions (including `setf` ones), generic functions and methods (including `setf` ones), method combinations, conditions, structures, classes, and types.

Programmatic definitions are as complete and exhaustive as introspection can make them. `Declt` collects documentation strings, lambda lists (including qualifiers and specializers where appropriate), slot definitions (including type information, allocation type, initialization arguments, *etc.*), definition sources, *etc.*

Every definition includes a full set of cross-references to related ones: ASDF component dependencies, parents, and children, classes direct methods, super- and sub-classes, slot readers and writers, `setf` expanders access and update functions, *etc.*

Finally, `Declt` produces exhaustive and multiple-entry indexes to all documented aspect of the library.

`Declt` manuals are generated in Texinfo format. From there it is possible to produce readable / printable output in Info, HTML, PDF, PostScript, *etc.*

The `Declt` Reference Manual, which you are currently reading, is the primary example of documentation generated by `Declt` itself. See *The Declt User Manual*, for a more human-readable guide to using `Declt`.

2 Systems

The main system appears first, followed by any subsystem dependency.

2.1 net.didierverna.declt

A reference manual generator for Common Lisp libraries

Long Name

Documentation Extractor from Common Lisp to Texinfo

Author Didier Verna

Contact didier@didierverna.net

Home Page

<http://www.lrde.epita.fr/~didier/software/lisp/typesetting.php#declt>

Source Control

<https://github.com/didierverna/declt>

License BSD

Long Description

Declt (pronounce dec'let) is a reference manual generator for Common Lisp. It extracts and formats documentation from ASDF systems, including the system itself, its local dependencies (subsystems), components, packages and an extensive list of definitions (variables, functions etc.). The formatted documentation comes with full indexing and cross-references.

Reference manuals are generated in Texinfo format which can subsequently be converted into info, HTML, DVI, PostScript or PDF.

If Feature :sbcl

Dependencies

- [net.didierverna.declt.setup], page 5 (system).
- [net.didierverna.declt.core], page 6 (system).

Source [net.didierverna.declt.asd], page 11.

2.2 net.didierverna.declt.setup

Declt's preload setup

Long Name

Documentation Extractor from Common Lisp to Texinfo, setup library

Author Didier Verna

Contact didier@didierverna.net

Home Page

<http://www.lrde.epita.fr/~didier/software/lisp/typesetting.php#declt>

Source Control

<https://github.com/didierverna/declt>

License BSD

Long Description

The Declt setup library provides support for various preload configuration parameters and meta-utilities. For a more complete description of Declt, see the ‘net.didierverna.declt’ system.

Dependency

named-readtables (system).

Source [net.didierverna.declt.setup.asd], page 11.

Child Components

- [package.lisp], page 11 (file).
- [src], page 9 (module).

2.3 net.didierverna.declt.core

Declt’s core functionality

Long Name

Documentation Extractor from Common Lisp to Texinfo, core library

Author Didier Verna

Contact didier@didierverna.net

Home Page

<http://www.lrde.epita.fr/~didier/software/lisp/typesetting.php#declt>

Source Control

<https://github.com/didierverna/declt>

License BSD

Long Description

The Declt core library provides the main functionality of Declt. For a more complete description of Declt, see the ‘net.didierverna.declt’ system.

If Feature :sbcl

Dependencies

- sb-introspect (system)., required, for feature :sbcl
- [net.didierverna.declt.setup], page 5 (system).
- [net.didierverna.declt.assess], page 6 (system).

Source [net.didierverna.declt.core.asd], page 11.

Child Components

- [package.lisp], page 13 (file).
- [src], page 9 (module).

2.4 net.didierverna.declt.assess

Declt’s information gathering pipeline stage

Long Name

Documentation Extractor from Common Lisp to Texinfo, assessment library

Author Didier Verna

Contact didier@didierverna.net

Home Page

<http://www.lrde.epita.fr/~didier/software/lisp/typesetting.php#declt>

Source Control

<https://github.com/didierverna/declt>

License BSD

Long Description

The Declt assessment library collects information from ASDF systems by introspection, and produces an abstract representation, independent from both the final manual's organization and the output format. For a more complete description of Declt, see the 'net.didierverna.declt' system.

If Feature :sbcl

Dependencies

- `sb-introspect` (system)., required, for feature `:sbcl`
- `[net.didierverna.declt.setup]`, page 5 (system).

Source `[net.didierverna.declt.assess.asd]`, page 11.

Child Components

- `[package.lisp]`, page 19 (file).
- `[src]`, page 10 (module).

3 Modules

Modules are listed depth-first from the system components tree.

3.1 net.didierverna.declt.setup/src

Dependency

[package.lisp], page 11 (file).

Source [net.didierverna.declt.setup.asd], page 11.

Parent Component

[net.didierverna.declt.setup], page 5 (system).

Child Components

- [configuration.lisp], page 11 (file).
- [readtable.lisp], page 12 (file).
- [version.lisp], page 12 (file).
- [util.lisp], page 12 (file).

3.2 net.didierverna.declt.core/src

Dependency

[package.lisp], page 13 (file).

Source [net.didierverna.declt.core.asd], page 11.

Parent Component

[net.didierverna.declt.core], page 6 (system).

Child Components

6 Definitions

Definitions are sorted by export status, category, package, and then by lexicographic order.

6.1 Public Interface

6.1.1 Special variables

copyright-years [Special Variable]

A string denoting the copyright years for the whole project.

Package [net.didierverna.declt.setup], page 36.

Source [version.lisp], page 12.

release-major-level [Special Variable]

The major level of this release.

Package [net.didierverna.declt.setup], page 36.

Source [version.lisp], page 12.

release-minor-level [Special Variable]

The minor level of this release.

Package [net.didierverna.declt.setup], page 36.

Source [version.lisp], page 12.

release-name [Special Variable]

The name of this release.

The general naming theme for Declt is "Star Trek characters".

Package [net.didierverna.declt.setup], page 36.

Source [version.lisp], page 12.

release-status [Special Variable]

The status of this release.

Package [net.didierverna.declt.setup], page 36.

Source [version.lisp], page 12.

release-status-level [Special Variable]

The status level of this release.

Package [net.didierverna.declt.setup], page 36.

Source [version.lisp], page 12.

6.1.2 Macros

declare-valid-superclass (*class superclass*) [Macro]

Validate SUPERCLASS classes for CLASS classes.

Package [net.didierverna.declt.setup], page 36.

Source [util.lisp], page 12.

- defabstract** (*class super-classes slots &rest options*) [Macro]
 Like DEFCLASS, but define an abstract class.
- Package** [net.didierverna.declt.setup], page 36.
- Source** [util.lisp], page 12.
- endpush** (*object place*) [Macro]
 Push OBJECT at the end of PLACE.
- Package** [net.didierverna.declt.setup], page 36.
- Source** [util.lisp], page 12.
- when-let** (*bindings &body body*) [Macro]
 Execute BODY only when all BINDINGS are non-nil.
 BINDINGS must be either a single binding of the form (VARIABLE VALUE), or a list of such. VALUES are computed sequentially in the specified order, and then VARIABLES are bound to the corresponding VALUES. If all VALUES are non-nil, BODY is executed.
- Package** [net.didierverna.declt.setup], page 36.
- Source** [util.lisp], page 12.
- when-let*** (*bindings &body body*) [Macro]
 Execute BODY only when all BINDINGS are non-nil.
 BINDINGS must be either a single binding of the form (VARIABLE VALUE), or a list of such. VARIABLES are bound to their respective VALUE sequentially, so that each VALUE expression may refer to a previously bound VARIABLE. Execution stops completely as soon as a null VALUE is encountered. Otherwise, BODY is executed as an implicit PROGN.
- Package** [net.didierverna.declt.setup], page 36.
- Source** [util.lisp], page 12.
- while** (*test &body body*) [Macro]
 Execute BODY while TEST.
- Package** [net.didierverna.declt.setup], page 36.
- Source** [util.lisp], page 12.

6.1.3 Ordinary functions

- allocation** (*definition*) [Function]
 Return CLOS slot DEFINITION's allocation type.
- Package** [net.didierverna.declt.assess], page 29.
- Source** [symbol.lisp], page 20.
- assess** (*system-name &key introspection-level library-name tagline library-version contact copyright-years license introduction conclusion*) [Function]
 Extract and return documentation information for ASDF SYSTEM-NAME.
 The documentation information is returned in a REPORT structure, which see.
 SYSTEM-NAME is an ASDF system designator. The following keyword parameters allow to specify or override some bits of information.
- INTROSPECTION-LEVEL: how hard to introspect the Lisp environment. At level 1 (the default), scan only the symbols from domestic packages. At level 2, scan all accessible symbols

in the Lisp environment. Some additional information may be discovered in the process, at the expense of a much higher computation time.

- **LIBRARY-NAME**: name of the library being documented. Defaults to the system name.
- **TAGLINE**: small text to be used as the manual's subtitle, or NIL. Defaults to the system long name or description.
- **LIBRARY-VERSION**: version information, or NIL. Defaults to the system version.
- **CONTACT**: contact information, or NIL. The default value is computed from the system maintainer(s), author(s), and mailto information. Accepts a contact string, or a list of such. See 'parse-contact-string' for more information.
- **COPYRIGHT-YEARS**: copyright years information or NIL. Defaults to the current year.
- **LICENSE**: license information. Defaults to NIL. Also accepts :mit, :boost, :bsd, :gpl, :lgpl, and :ms-pl.
- **INTRODUCTION**: introduction chapter contents in Texinfo format. Defaults to NIL.
- **CONCLUSION**: conclusion chapter contents in Texinfo format. Defaults to NIL.

Package [net.didierverna.declt.assess], page 29.

Source [assess.lisp], page 27.

bug-tracker (*definition*) [Function]

Return system DEFINITION's bug tracker, or NIL.

Package [net.didierverna.declt.assess], page 29.

Source [asdf.lisp], page 25.

combination-options (*definition*) [Function]

Return generic function DEFINITION's method combination options.

Package [net.didierverna.declt.assess], page 29.

Source [symbol.lisp], page 20.

component-definition-p (*definition*) [Function]

Return T if DEFINITION is a component definition.

Package [net.didierverna.declt.assess], page 29.

Source [asdf.lisp], page 25.

configuration (*key*) [Function]

Return KEY's value in the current Declt configuration.

Package [net.didierverna.declt.setup], page 36.

Source [configuration.lisp], page 11.

configure (*key value*) [Function]

Set KEY to VALUE in the current Declt configuration.

Package [net.didierverna.declt.setup], page 36.

Source [configuration.lisp], page 11.

declt (*system-name &rest keys &key introspection-level library-name* [Function]
tagline library-version contact copyright-years license introduction conclusion
locations default-values foreign-definitions declt-notice output-directory
file-name info-name info-category)

Generate a reference manual for ASDF SYSTEM-NAME.

The reference manual is currently generated in Texinfo format.

For a description of SYSTEM-NAME, INTROSPECTION-LEVEL, LIBRARY-NAME, TAGLINE, LIBRARY-VERSION, CONTACT, COPYRIGHT-YEARS, LICENSE, INTRODUCTION, and CONCLUSION, see ‘assess’.

For a description of LOCATIONS, DEFAULT-VALUES, FOREIGN-DEFINITIONS, and DECLT-NOTICE, see ‘make-context’.

The following keyword parameters are also available.

- OUTPUT-DIRECTORY: output directory for the generated reference manual. Defaults to the current directory.

- FILE-NAME: base name for the generated reference manual, sans extension. Defaults to the system name.

- INFO-NAME: base name for the subsequent Info file, sans extension (this name appears in the Texinfo file). Defaults to FILE-NAME.

- INFO-CATEGORY: category under which to install the Info file (technically, this provides the value for Texinfo’s @dircategory command).

Defaults to "Common Lisp".

Package [net.didierverna.declt], page 36.

Source [declt.lisp], page 19.

definition-version (*definition*) [Function]

Return component DEFINITION’s version string.

Package [net.didierverna.declt.assess], page 29.

Source [asdf.lisp], page 25.

description (*definition*) [Function]

Return component DEFINITION’s description.

Package [net.didierverna.declt.assess], page 29.

Source [asdf.lisp], page 25.

direct-default-initargs (*definition*) [Function]

Return CLOS classoid mixin DEFINITION’s direct default initargs.

Package [net.didierverna.declt.assess], page 29.

Source [symbol.lisp], page 20.

extension (*definition*) [Function]

Return file DEFINITION’s file extension, if any.

Package [net.didierverna.declt.assess], page 29.

Source [asdf.lisp], page 25.

- file-definition-p** (*definition*) [Function]
Return T if DEFINITION is a file definition.
Package [net.didierverna.declt.assess], page 29.
Source [asdf.lisp], page 25.
- find*** (*object list &key test key pre-test*) [Function]
Return the first finding of OBJECT in LIST, or NIL.
Each item in LIST is TESTed with EQ by default. TEST is performed on the item itself by default, or on the result of applying KEY to it. Optionally, only items satisfying PRE-TEST are considered.
Package [net.didierverna.declt.setup], page 36.
Source [util.lisp], page 12.
- homepage** (*definition*) [Function]
Return system DEFINITION's homepage, or NIL.
Package [net.didierverna.declt.assess], page 29.
Source [asdf.lisp], page 25.
- identity-with-one-argument** (*definition*) [Function]
Return short combination DEFINITION's :identity-with-one-argument option.
Package [net.didierverna.declt.assess], page 29.
Source [symbol.lisp], page 20.
- if-feature** (*definition*) [Function]
Return component DEFINITION's if-feature.
Package [net.didierverna.declt.assess], page 29.
Source [asdf.lisp], page 25.
- initargs** (*definition*) [Function]
Return CLOS slot DEFINITION's initargs.
Package [net.didierverna.declt.assess], page 29.
Source [symbol.lisp], page 20.
- initform** (*definition*) [Function]
Return CLOS slot DEFINITION's initform.
Package [net.didierverna.declt.assess], page 29.
Source [symbol.lisp], page 20.
- license-name** (*definition*) [Function]
Return system DEFINITION's license name, or NIL.
Package [net.didierverna.declt.assess], page 29.
Source [asdf.lisp], page 25.
- lisp-file-definition-p** (*definition*) [Function]
Return T if DEFINITION is a Lisp file definition.
Package [net.didierverna.declt.assess], page 29.
Source [asdf.lisp], page 25.

- long-description** (*definition*) [Function]
 Return component DEFINITION's long description.
Package [net.didierverna.declt.assess], page 29.
Source [asdf.lisp], page 25.
- long-name** (*definition*) [Function]
 Return system DEFINITION's long name, or NIL.
Package [net.didierverna.declt.assess], page 29.
Source [asdf.lisp], page 25.
- mailto** (*definition*) [Function]
 Return system DEFINITION's mailto, or NIL.
Package [net.didierverna.declt.assess], page 29.
Source [asdf.lisp], page 25.
- mapcat** (*function &rest lists*) [Function]
 Short for "mapconcat": non destructive version of MAPCAN. That is, concatenate the results with APPEND rather than NCONC.
Package [net.didierverna.declt.setup], page 36.
Source [util.lisp], page 12.
- method-definition-p** (*definition*) [Function]
 Return T if DEFINITION is a method definition.
Package [net.didierverna.declt.assess], page 29.
Source [symbol.lisp], page 20.
- module-definition-p** (*definition*) [Function]
 Return T if DEFINITION is a module definition.
Package [net.didierverna.declt.assess], page 29.
Source [asdf.lisp], page 25.
- nickname-package** (**&optional** *nickname*) [Function]
 Add NICKNAME (:DECLT by default) to the :NET.DIDIERVERNA.DECLT package.
Package [net.didierverna.declt], page 36.
Source [package.lisp], page 13.
- nicknames** (*package-definition*) [Function]
 Return the list of nicknames for PACKAGE-DEFINITION.
Package [net.didierverna.declt.assess], page 29.
Source [package.lisp], page 24.
- non-empty-string-p** (*object*) [Function]
 Return T if OBJECT is a non-empty string.
Package [net.didierverna.declt.setup], page 36.
Source [util.lisp], page 12.

- package-definition-p** (*definition*) [Function]
Return T if DEFINITION is a package definition.
- Package** [net.didierverna.declt.assess], page 29.
- Source** [package.lisp], page 24.
- publicp** (*definition*) [Function]
Return T is DEFINITION is public.
A definition is public when the symbol naming it has a home package, and is exported from it.
- Package** [net.didierverna.declt.assess], page 29.
- Source** [symbol.lisp], page 20.
- qualifiers** (*definition*) [Function]
Return method DEFINITION's method qualifiers.
- Package** [net.didierverna.declt.assess], page 29.
- Source** [symbol.lisp], page 20.
- reader-method-definition-p** (*definition*) [Function]
Return T if DEFINITION is a reader method definition.
- Package** [net.didierverna.declt.assess], page 29.
- Source** [symbol.lisp], page 20.
- retain** (*object list &key test key pre-test*) [Function]
Return a copy of LIST from which only OBJECT is retained.
Each item in LIST is TESTed with EQ by default. TEST is performed on the item itself by default, or on the result of applying KEY to it. Optionally, only items satisfying PRE-TEST are considered.
- Package** [net.didierverna.declt.setup], page 36.
- Source** [util.lisp], page 12.
- short-expander-definition-p** (*definition*) [Function]
Return T if DEFINITION is a short expander definition.
- Package** [net.didierverna.declt.assess], page 29.
- Source** [symbol.lisp], page 20.
- source-control** (*definition*) [Function]
Return system DEFINITION's source control, or NIL.
- Package** [net.didierverna.declt.assess], page 29.
- Source** [asdf.lisp], page 25.
- symbol-definition-p** (*definition*) [Function]
Return T if DEFINITION is a symbol definition.
- Package** [net.didierverna.declt.assess], page 29.
- Source** [symbol.lisp], page 20.

`system-definition-p` (*definition*) [Function]

Return T if DEFINITION is a system definition.

Package [net.didierverna.declt.assess], page 29.

Source [asdf.lisp], page 25.

`version` (**&optional** *type*) [Function]

Return the current version of Declt.

TYPE can be one of :number, :short or :long.

A version number is computed as $\text{major} \times 10000 + \text{minor} \times 100 + \text{patchlevel}$, leaving two digits for each level. Alpha, beta and rc status are ignored in version numbers.

A short version is something like 1.3{a,b,rc}4, or 1.3.4 for patchlevel. Alpha, beta or rc levels start at 1. Patchlevels start at 0 but are ignored in the output, so that 1.3.0 appears as just 1.3.

A long version is something like

1.3 {alpha,beta,release candidate,patchlevel} 4 "James T. Kirk". As for the short version, a patchlevel of 0 is ignored in the output.

Package [net.didierverna.declt.setup], page 36.

Source [version.lisp], page 12.

`writer-method-definition-p` (*definition*) [Function]

Return T if DEFINITION is a writer method definition.

Package [net.didierverna.declt.assess], page 29.

Source [symbol.lisp], page 20.

6.1.4 Generic functions

`authors` (*object*) [Generic Reader]

`(setf authors)` (*object*) [Generic Writer]

Package [net.didierverna.declt.assess], page 29.

Methods

`authors` ((*system-definition* [`system-definition`],
page 100)) [Reader Method]

`(setf authors)` ((*system-definition*
[`system-definition`], page 100)) [Writer Method]

The list of parsed author contacts.

See ‘parse-contact-string’ for more information.

Source [asdf.lisp], page 25.

Target Slot

[authors], page 101.

`children` (*object*) [Generic Reader]

`(setf children)` (*object*) [Generic Writer]

Package [net.didierverna.declt.assess], page 29.

Methods

<p><code>children</code> ((<i>module-definition</i> [<i>module-definition</i>], page 90))</p> <p>(<code>setf children</code>) ((<i>module-definition</i> [<i>module-definition</i>], page 90))</p> <p>The list of child definitions for this definition's module.</p> <p>Source [asdf.lisp], page 25.</p> <p>Target Slot [children], page 91.</p>	<p>[Reader Method]</p> <p>[Writer Method]</p>
<p><code>classoid</code> (<i>object</i>)</p> <p>Package [net.didierverna.declt.assess], page 29.</p> <p>Methods</p> <p><code>classoid</code> ((<i>classoid-definition</i> [<i>classoid-definition</i>], page 76))</p> <p>automatically generated reader method</p> <p>Source [symbol.lisp], page 20.</p> <p>Target Slot [object], page 77.</p>	<p>[Generic Reader]</p> <p>[Reader Method]</p>
<p><code>clients</code> (<i>object</i>)</p> <p>(<code>setf clients</code>) (<i>object</i>)</p> <p>Package [net.didierverna.declt.assess], page 29.</p> <p>Methods</p> <p><code>clients</code> ((<i>combination-definition</i> [<i>combination-definition</i>], page 78))</p> <p>(<code>setf clients</code>) ((<i>combination-definition</i> [<i>combination-definition</i>], page 78))</p> <p>The list of client definitions for this definition's method combination. These are generic functions using this combination.</p> <p>Source [symbol.lisp], page 20.</p> <p>Target Slot [clients], page 79.</p>	<p>[Generic Reader]</p> <p>[Generic Writer]</p> <p>[Reader Method]</p> <p>[Writer Method]</p>
<p><code>combination</code> (<i>object</i>)</p> <p>(<code>setf combination</code>) (<i>object</i>)</p> <p>Package [net.didierverna.declt.assess], page 29.</p> <p>Methods</p> <p><code>combination</code> ((<i>generic-function-definition</i> [<i>generic-function-definition</i>], page 86))</p> <p>(<code>setf combination</code>) ((<i>generic-function-definition</i> [<i>generic-function-definition</i>], page 86))</p> <p>The method combination definition for this definition's generic function.</p> <p>Source [symbol.lisp], page 20.</p> <p>Target Slot [combination], page 87.</p>	<p>[Generic Reader]</p> <p>[Generic Writer]</p> <p>[Reader Method]</p> <p>[Writer Method]</p>

- combination** ((*combination-definition* [combination-definition], page 78)) [Reader Method]
 automatically generated reader method
Source [symbol.lisp], page 20.
Target Slot [object], page 79.
- component** (*object*) [Generic Reader]
Package [net.didierverna.declt.assess], page 29.
Methods
- component** ((*component-definition* [component-definition], page 80)) [Reader Method]
 automatically generated reader method
Source [asdf.lisp], page 25.
Target Slot [object], page 81.
- conclusion** (*object*) [Generic Reader]
(setf conclusion) (*object*) [Generic Writer]
Package [net.didierverna.declt.assess], page 29.
Methods
- conclusion** ((*report* [report], page 93)) [Reader Method]
(setf conclusion) ((*report* [report], page 93)) [Writer Method]
 Contents for a conclusion chapter.
Source [assess.lisp], page 27.
Target Slot [conclusion], page 95.
- contacts** (*object*) [Generic Reader]
(setf contacts) (*object*) [Generic Writer]
Package [net.didierverna.declt.assess], page 29.
Methods
- contacts** ((*report* [report], page 93)) [Reader Method]
(setf contacts) ((*report* [report], page 93)) [Writer Method]
 The list of contacts for the library.
 Each element is of the form (NAME . EMAIL) where both NAME and EMAIL are strings or NIL, and cannot be null at the same time.
Source [assess.lisp], page 27.
Target Slot [contacts], page 94.
- copyright-years** (*object*) [Generic Reader]
(setf copyright-years) (*object*) [Generic Writer]
Package [net.didierverna.declt.assess], page 29.
Methods

<p>copyright-years ((<i>report</i> [<i>report</i>], <i>page 93</i>)) (setf copyright-years) ((<i>report</i> [<i>report</i>], <i>page 93</i>)) A copyright years string.</p> <p>Source [assess.lisp], page 27.</p> <p>Target Slot [<i>copyright-years</i>], page 94.</p>	<p>[Reader Method] [Writer Method]</p>
<p>definition-class (<i>object</i>)</p> <p>Package [net.didierverna.declt.assess], page 29.</p> <p>Methods</p>	<p>[Generic Reader]</p>

- definition-function** (*(function-definition* [function-definition], page 85)) [Reader Method]
 automatically generated reader method
Source [symbol.lisp], page 20.
Target Slot [object], page 86.
- definition-method** (*object*) [Generic Reader]
Package [net.didierverna.declt.assess], page 29.
Methods
- definition-method** (*(method-definition* [method-definition], page 89)) [Reader Method]
 automatically generated reader method
Source [symbol.lisp], page 20.
Target Slot [object], page 90.
- definition-package** (*object*) [Generic Reader]
Package [net.didierverna.declt.assess], page 29.
Methods
- definition-package** (*(package-definition* [package-definition], page 92)) [Reader Method]
 automatically generated reader method
Source [package.lisp], page 24.
Target Slot [object], page 92.
- definition-structure** (*object*) [Generic Reader]
Package [net.didierverna.declt.assess], page 29.
Methods
- definition-structure** (*(structure-definition* [structure-definition], page 98)) [Reader Method]
 automatically generated reader method
Source [symbol.lisp], page 20.
Target Slot [object], page 99.
- definition-symbol** (*object*) [Generic Reader]
Package [net.didierverna.declt.assess], page 29.
Methods
- definition-symbol** (*(symbol-definition* [symbol-definition], page 99)) [Reader Method]
 The symbol naming this definition.
Source [symbol.lisp], page 20.
Target Slot [symbol], page 99.

<code>definitions</code> (<i>object</i>)	[Generic Reader]
<code>(setf definitions)</code> (<i>object</i>)	[Generic Writer]
Package [net.didierverna.declt.assess], page 29.	
Methods	
<code>definitions</code> ((<i>report</i> [<i>report</i>], page 93))	[Reader Method]
<code>(setf definitions)</code> ((<i>report</i> [<i>report</i>], page 93))	[Writer Method]
The list of definitions.	
Source [assess.lisp], page 27.	
Target Slot	
[definitions], page 95.	
<code>definitions</code> ((<i>lisp-file-definition</i> [<i>lisp-file-definition</i>], page 88))	[Reader Method]
<code>(setf definitions)</code> ((<i>lisp-file-definition</i> [<i>lisp-file-definition</i>], page 88))	[Writer Method]
The list of definitions for this definition's file.

[definitions], page 88.	
<code>definitions</code> ((<i>package-definition</i> [<i>package-definition</i>], page 92))	[Reader Method]
<code>(setf definitions)</code> ((<i>package-definition</i> [<i>package-definition</i>], page 92))	[Writer Method]
The list of corresponding definitions.	
Source [package.lisp], page 24.	
Target Slot	
[definitions], page 93.	
<code>defsystem-dependencies</code> (<i>object</i>)	[Generic Reader]
<code>(setf defsystem-dependencies)</code> (<i>object</i>)	[Generic Writer]
Package [net.didierverna.declt.assess], page 29.	
Methods	
<code>defsystem-dependencies</code> ((<i>system-definition</i> [<i>system-definition</i>], page 100))	[Reader Method]
<code>(setf defsystem-dependencies)</code> ((<i>system-definition</i> [<i>system-definition</i>], page 100))	[Writer Method]
The list of defsystem dependency definitions.	
Source [asdf.lisp], page 25.	
Target Slot	
[defsystem-dependencies], page 101.	
<code>dependencies</code> (<i>object</i>)	[Generic Reader]
<code>(setf dependencies)</code> (<i>object</i>)	[Generic Writer]
Package [net.didierverna.declt.assess], page 29.	
Methods	

- `dependencies` (*(component-definition* [Reader Method]
[component-definition], page 80))
- `(setf dependencies)` (*(component-definition* [Writer Method]
[component-definition], page 80))
- The list of dependency definitions for this definition's component.
- Source** [asdf.lisp], page 25.
- Target Slot**
 [dependencies], page 81.
- `direct-methods` (*object*) [Generic Reader]
`(setf direct-methods)` (*object*) [Generic Writer]
- Package** [net.didierverna.declt.assess], page 29.
- Methods**
- `direct-methods` (*(clos-classoid-mixin* [Reader Method]
[clos-classoid-mixin], page 77))
- `(setf direct-methods)` (*(clos-classoid-mixin* [Writer Method]
[clos-classoid-mixin], page 77))
- The list of direct method definitions for this definition's classoid.
- Source** [symbol.lisp], page 20.
- Target Slot**
 [direct-methods], page 78.
- `direct-slots` (*object*) [Generic Reader]
`(setf direct-slots)` (*object*) [Generic Writer]
- Package** [net.didierverna.declt.assess], page 29.
- Methods**
- `direct-slots` (*(classoid-definition* [Reader Method]
[classoid-definition], page 76))
- `(setf direct-slots)` (*(classoid-definition* [Writer Method]
[classoid-definition], page 76))
- The list of direct slot definitions for this definition's classoid.
- Source** [symbol.lisp], page 20.
- Target Slot**
 [direct-slots], page 77.
- `direct-subclasses` (*object*) [Generic Reader]
- Package** [net.didierverna.declt.assess], page 29.
- Methods**
- `direct-subclasses` (*(class-definition* [Reader Method]
[class-definition], page 75))
 automatically generated reader method
- Source** [symbol.lisp], page 20.

- `direct-superclassoids` (*object*) [Generic Reader]
`(setf direct-superclassoids)` (*object*) [Generic Writer]
Package [net.didierverna.declt.assess], page 29.
Methods

- `direct-superclassoids` (`((clos-classoid-mixin [clos-classoid-mixin], page 77))`) [Reader Method]
`(setf direct-superclassoids)` [Writer Method]
`((clos-classoid-mixin [clos-classoid-mixin], page 77))`
 The list of direct superclassoid definitions for this definition's classoid.
Source [symbol.lisp], page 20.
Target Slot
 [direct-superclassoids], page 77.
- `direct-superconditions` (*object*) [Generic Reader]
Package [net.didierverna.declt.assess], page 29.
Methods
- `direct-superconditions` (`((condition-definition [condition-definition], page 81))`) [Reader Method]
 automatically generated reader method
Source [symbol.lisp], page 20.
Target Slot
 [direct-superclassoids], page 81.
- `(setf direct-superconditions)` (*object*) [Generic Writer]
Package [net.didierverna.declt.assess], page 29.
Methods
- `(setf direct-superconditions)` [Writer Method]
`((condition-definition [condition-definition], page 81))`
 automatically generated writer method
Source [symbol.lisp], page 20.
Target Slot
 [direct-superclassoids], page 81.
- `direct-superstructures` (*object*) [Generic Reader]
Package [net.didierverna.declt.assess], page 29.
Methods
- `direct-superstructures` (`((clos-structure-definition [clos-structure-definition], page 78))`) [Reader Method]
 automatically generated reader method
Source [symbol.lisp], page 20.
Target Slot
 [direct-superclassoids], page 78.
- `(setf direct-superstructures)` (*object*) [Generic Writer]
Package [net.didierverna.declt.assess], page 29.
Methods

`(setf direct-superstructures)` [Writer Method]
 ((*clos-structure-definition* [`clos-structure-definition`],
page 78)
 automatically generated writer method

Source [symbol.lisp], page 20.

Target Slot
 [direct-superclassoids], page 78.

`docstring` (*definition*) [Generic Function]
 Return DEFINITION's docstring (Lisp documentation).

Package [net.didierverna.declt.assess], page 29.

Source [definition.lisp], page 19.

Methods

`docstring` ((*definition* [`component-definition`], *page 80*) [Method]
 Return component DEFINITION's description. This is the same as the 'description' function.

Source [asdf.lisp], page 25.

`docstring` ((*definition* [`function-alias-definition`], [Method]
page 85)

Return function alias DEFINITION's docstring. This is the docstring attached to DEFINITION's name, rather than the one attached to the function.

Source [symbol.lisp], page 20.

`docstring` ((*definition* [Method]
 [`compiler-macro-alias-definition`], *page 79*)

Return compiler macro alias DEFINITION's docstring.

This is the docstring attached to DEFINITION's name, rather than the one attached to the compiler macro function.

Source [symbol.lisp], page 20.

`docstring` ((*definition* [Method]
 [`macro-alias-definition`], *page 89*)

Return macro alias DEFINITION's docstring.

This is the docstring attached to DEFINITION's symbol, rather than the one attached to the macro function.

Source [symbol.lisp], page 20.

`docstring` ((*definition* [Method]
 [`typed-structure-slot-definition`], *page 102*)

Return NIL.

Source [symbol.lisp], page 20.

`docstring` ((*definition* [`clos-slot-definition`], *page 78*) [Method]

Return CLOS slot DEFINITION's docstring.

Source [symbol.lisp], page 20.

- `docstring` ((*definition* [*typed-structure-definition*], page 102)) [Method]
 Return typed structure DEFINITION's docstring.
Source [symbol.lisp], page 20.
- `docstring` ((*definition* [*combination-definition*], page 78)) [Method]
 Return method combination DEFINITION's docstring.
Source [symbol.lisp], page 20.
- `docstring` ((*definition* [*expander-definition*], page 83)) [Method]
 Return setf expander DEFINITION's docstring.
Source [symbol.lisp], page 20.
- `docstring` ((*definition* [*type-definition*], page 101)) [Method]
 Return type DEFINITION's docstring.
Source [symbol.lisp], page 20.
- `docstring` ((*definition* [*symbol-macro-definition*], page 100)) [Method]
 Return NIL (symbol macros don't have a docstring).
Source [symbol.lisp], page 20.
- `docstring` ((*definition* [*variable-definition*], page 103)) [Method]
 Return variable DEFINITION's docstring.
Source [symbol.lisp], page 20.
- `docstring` (*definition*) [Method]
 Return DEFINITION's object canonical documentation. This is the default method.
- `element-type` (*object*) [Generic Reader]
`(setf element-type)` (*object*) [Generic Writer]
Package [net.didierverna.declt.assess], page 29.
Methods
- `element-type` ((*typed-structure-definition* [*typed-structure-definition*], page 102)) [Reader Method]
`(setf element-type)` ((*typed-structure-definition* [*typed-structure-definition*], page 102)) [Writer Method]
 The structure's element type.
 It is T for list structures, but may be something else for vector ones.
Source [symbol.lisp], page 20.
Target Slot
 [element-type], page 102.
- `expander` (*object*) [Generic Reader]
Package [net.didierverna.declt.assess], page 29.
Methods

- expander** ((*expander-definition* [expander-definition], page 83)) [Reader Method]
 automatically generated reader method
Source [symbol.lisp], page 20.
Target Slot [object], page 84.
- expander** ((*type-definition* [type-definition], page 101)) [Reader Method]
 automatically generated reader method
Source [symbol.lisp], page 20.
Target Slot [object], page 102.
- expander-for** (*object*) [Generic Reader]
 (setf **expander-for**) (*object*) [Generic Writer]
Package [net.didierverna.declt.assess], page 29.
Methods
- expander-for** ((*setfable-funcoid-definition* [setfable-funcoid-definition], page 95)) [Reader Method]
 (setf **expander-for**) ((*setfable-funcoid-definition* [setfable-funcoid-definition], page 95)) [Writer Method]
 A setf expander definition for this funcoid, or NIL.
 This is the definition of a setf expander that expands forms identical to this funcoid's signature. There can be only one. Note that the Common Lisp standard does not impose any actual relation between the setf expander and its access-fn. In fact, the access-fn may not even exist at all. However, if it does, it is very likely that it is a reader for the place updated by this setf expander.
Source [symbol.lisp], page 20.
Target Slot [expander-for], page 95.
- expanders-to** (*object*) [Generic Reader]
 (setf **expanders-to**) (*object*) [Generic Writer]
Package [net.didierverna.declt.assess], page 29.
Methods
- expanders-to** ((*setfable-funcoid-definition* [setfable-funcoid-definition], page 95)) [Reader Method]
 (setf **expanders-to**) ((*setfable-funcoid-definition* [setfable-funcoid-definition], page 95)) [Writer Method]
 The list of setf expander definitions to this funcoid.
 This is a list of definitions for short form setf expanders that have this funcoid as their update-fn. There might be more than one.
Source [symbol.lisp], page 20.
Target Slot [expanders-to], page 96.

<code>file</code> (<i>object</i>)	[Generic Reader]
Package [net.didierverna.declt.assess], page 29.	
Methods	
<code>file</code> ((<i>file-definition</i> [<i>file-definition</i>], page 84))	[Reader Method]
automatically generated reader method	
Source [asdf.lisp], page 25.	
Target Slot	
[object], page 84.	
<code>foreignp</code> (<i>object</i>)	[Generic Reader]
<code>(setf foreignp)</code> (<i>object</i>)	[Generic Writer]
Package [net.didierverna.declt.assess], page 29.	
Methods	
<code>foreignp</code> ((<i>definition</i> [<i>definition</i>], page 82))	[Reader Method]
<code>(setf foreignp)</code> ((<i>definition</i> [<i>definition</i>], page 82))	[Writer Method]
Whether this definition is foreign.	
Source [definition.lisp], page 19.	
Target Slot	
[foreign], page 83.	
<code>funcoid</code> (<i>object</i>)	[Generic Reader]
Package [net.didierverna.declt.assess], page 29.	
Methods	
<code>funcoid</code> ((<i>funcoid-definition</i> [<i>funcoid-definition</i>], page 84))	[Reader Method]
automatically generated reader method	
Source [symbol.lisp], page 20.	
Target Slot	
[object], page 85.	
<code>generic</code> (<i>object</i>)	[Generic Reader]
Package [net.didierverna.declt.assess], page 29.	
Methods	
<code>generic</code> ((<i>generic-function-definition</i> [<i>generic-function-definition</i>], page 86))	[Reader Method]
automatically generated reader method	
Source [symbol.lisp], page 20.	
Target Slot	
[object], page 87.	
<code>home-package</code> (<i>object</i>)	[Generic Reader]
<code>(setf home-package)</code> (<i>object</i>)	[Generic Writer]
Package [net.didierverna.declt.assess], page 29.	
Methods	

- `home-package` (*(symbol-definition* [Reader Method]
[symbol-definition], page 99))
- `(setf home-package)` (*(symbol-definition* [Writer Method]
[symbol-definition], page 99))
- The home package definition for this definition's symbol.
 Every definition gets a home package, even foreign ones. A home package can only be null when the definition's symbol is uninterned.
- Source** [symbol.lisp], page 20.
- Target Slot**
 [home-package], page 100.
- `introduction` (*object*) [Generic Reader]
`(setf introduction)` (*object*) [Generic Writer]
- Package** [net.didierverna.declt.assess], page 29.
- Methods**
- `introduction` (*(report [report]*, page 93)) [Reader Method]
`(setf introduction)` (*(report [report]*, page 93)) [Writer Method]
 Contents for an introduction chapter.
- Source** [assess.lisp], page 27.
- Target Slot**
 [introduction], page 95.
- `lambda-list` (*definition*) [Generic Function]
 Return funcoid DEFINITION's lambda-list.
- Package** [net.didierverna.declt.assess], page 29.
- Source** [symbol.lisp], page 20.
- Methods**
- `lambda-list` (*(definition [alias-definition]*, page 74)) [Method]
 Return the lambda-list of alias DEFINITION's referee.
- `lambda-list` (*(definition [method-definition]*, page 89)) [Method]
 Return method DEFINITION's method lambda-list.
- `lambda-list` (*(definition [combination-definition]*, [Method]
page 78])
 Return method combination DEFINITION's lambda-list.
- `lambda-list` (*(definition [long-expander-definition]*, [Method]
page 88])
 Return long setf expander DEFINITION's expander function's lambda-list.
- `lambda-list` (*(definition [short-expander-definition]*, [Method]
page 96])
 Return short setf expander DEFINITION's lambda-list.
 This lambda-list is computed as the shortened version of DEFINITION's update-fn lambda-list, because setf expanders pass the new value as the last argument to their operator.
 If the expander's update-fn is not defined, return two values: NIL and T.

<code>lambda-list</code> ((<i>definition</i> [<i>type-definition</i>], page 101))	[Method]
Return type DEFINITION's type lambda-list.	
<code>lambda-list</code> ((<i>definition</i> [<i>funcoid-definition</i>], page 84))	[Method]
Return funcoid DEFINITION's function lambda-list. This is the default method.	
<code>lambda-list</code> <i>:around</i> ((<i>definition</i> [<i>funcoid-definition</i>], page 84))	[Method]
Return only the lambda-list's CDR for setf definitions.	
This only applies to compiler macros and functions (to filter out the parameter corresponding to the new value) but does nothing on setf expanders because their primary methods already do the filtering (differently).	
<code>library-name</code> (<i>object</i>)	[Generic Reader]
(<code>setf</code> <code>library-name</code>) (<i>object</i>)	[Generic Writer]
Package [net.didierverna.declt.assess], page 29.	
Methods	
<code>library-name</code> ((<i>report</i> [<i>report</i>], page 93))	[Reader Method]
(<code>setf</code> <code>library-name</code>) ((<i>report</i> [<i>report</i>], page 93))	[Writer Method]
The library's name.	
Source [assess.lisp], page 27.	
Target Slot	
[library-name], page 94.	
<code>library-version</code> (<i>object</i>)	[Generic Reader]
(<code>setf</code> <code>library-version</code>) (<i>object</i>)	[Generic Writer]
Package [net.didierverna.declt.assess], page 29.	
Methods	
<code>library-version</code> ((<i>report</i> [<i>report</i>], page 93))	[Reader Method]
(<code>setf</code> <code>library-version</code>) ((<i>report</i> [<i>report</i>], page 93))	[Writer Method]
The library's version.	
Source [assess.lisp], page 27.	
Target Slot	
[library-version], page 94.	
<code>license</code> (<i>object</i>)	[Generic Reader]
(<code>setf</code> <code>license</code>) (<i>object</i>)	[Generic Writer]
Package [net.didierverna.declt.assess], page 29.	
Methods	
<code>license</code> ((<i>report</i> [<i>report</i>], page 93))	[Reader Method]
(<code>setf</code> <code>license</code>) ((<i>report</i> [<i>report</i>], page 93))	[Writer Method]
The library's license.	
Source [assess.lisp], page 27.	
Target Slot	
[license], page 94.	

<code>location</code> (<i>object</i>)	[Generic Reader]
<code>(setf location)</code> (<i>object</i>)	[Generic Writer]
Package [net.didierverna.declt.assess], page 29.	
Methods	
<code>location</code> ((<i>component-definition</i> [<i>component-definition</i>], page 80))	[Reader Method]
<code>(setf location)</code> ((<i>component-definition</i> [<i>component-definition</i>], page 80))	[Writer Method]
The component's location (a namestring).	
Source [asdf.lisp], page 25.	
Target Slot [location], page 81.	
<code>macro</code> (<i>object</i>)	[Generic Reader]
Package [net.didierverna.declt.assess], page 29.	
Methods	
<code>macro</code> ((<i>macro-definition</i> [<i>macro-definition</i>], page 89))	[Reader Method]
automatically generated reader method	
Source [symbol.lisp], page 20.	
Target Slot [object], page 89.	
<code>maintainers</code> (<i>object</i>)	[Generic Reader]
<code>(setf maintainers)</code> (<i>object</i>)	[Generic Writer]
Package [net.didierverna.declt.assess], page 29.	
Methods	
<code>maintainers</code> ((<i>system-definition</i> [<i>system-definition</i>], page 100))	[Reader Method]
<code>(setf maintainers)</code> ((<i>system-definition</i> [<i>system-definition</i>], page 100))	[Writer Method]
The list of parsed maintainer contacts. See 'parse-contact-string' for more information.	
Source [asdf.lisp], page 25.	
Target Slot [maintainers], page 101.	
<code>methods</code> (<i>object</i>)	[Generic Reader]
<code>(setf methods)</code> (<i>object</i>)	[Generic Writer]
Package [net.didierverna.declt.assess], page 29.	
Methods	
<code>methods</code> ((<i>generic-function-definition</i> [<i>generic-function-definition</i>], page 86))	[Reader Method]
<code>(setf methods)</code> ((<i>generic-function-definition</i> [<i>generic-function-definition</i>], page 86))	[Writer Method]
The list of method definitions for this definition's generic function.	
Source [symbol.lisp], page 20.	

	Target Slot	
	[methods], page 87.	
module (<i>object</i>)		[Generic Reader]
Package	[net.didierverna.declt.assess], page 29.	
Methods		
module ((<i>module-definition</i> [<i>module-definition</i>], <i>page 90</i>))		[Reader Method]
automatically generated reader method		
Source	[asdf.lisp], page 25.	
Target Slot		
[object], page 90.		
name (<i>definition</i>)		[Generic Function]
The definition's name.		
This is the native Lisp name for the definition's corresponding object. It's either a string (for ASDF components and packages), a symbol, or a list of the form (setf symbol).		
Package	[net.didierverna.declt.assess], page 29.	
Source	[definition.lisp], page 19.	
Methods		
name ((<i>definition</i> [<i>component-definition</i>], <i>page 80</i>))		[Method]
Return component DEFINITION's component name.		
Source	[asdf.lisp], page 25.	
name ((<i>definition</i> [<i>package-definition</i>], <i>page 92</i>))		[Method]
Return package DEFINITION's package name.		
Source	[package.lisp], page 24.	
name :around ((<i>definition</i> [<i>alias-definition</i>], <i>page 74</i>))		[Method]
Wrap alias DEFINITION's name in a SETF list when appropriate.		
Source	[symbol.lisp], page 20.	
name :around ((<i>definition</i> [<i>funcoid-definition</i>], <i>page 84</i>))		[Method]
Wrap funcoid DEFINITION's name in a SETF list when appropriate.		
Source	[symbol.lisp], page 20.	
name ((<i>definition</i> [<i>symbol-definition</i>], <i>page 99</i>))		[Method]
Return symbol DEFINITION's symbol.		
Source	[symbol.lisp], page 20.	
object (<i>object</i>)		[Generic Reader]
Package	[net.didierverna.declt.assess], page 29.	
Methods		
object ((<i>definition</i> [<i>definition</i>], <i>page 82</i>))		[Reader Method]
The corresponding Lisp object, or NIL.		
Only constants, special variables, symbol macros, and aliases lack such an object.		
Source	[definition.lisp], page 19.	

	Target Slot	
	[object], page 82.	
<code>owner</code> (<i>object</i>)		[Generic Reader]
<code>(setf owner)</code> (<i>object</i>)		[Generic Writer]
Package	[net.didierverna.declt.assess], page 29.	
Methods		
<code>owner</code> ((<i>slot-definition</i> [<i>slot-definition</i>], page 97))		[Reader Method]
<code>(setf owner)</code> ((<i>slot-definition</i> [<i>slot-definition</i>], page 97))		[Writer Method]
	The definition for the owner of this definition's slot.	
Source	[symbol.lisp], page 20.	
Target Slot		
	[owner], page 97.	
<code>owner</code> ((<i>method-definition</i> [<i>method-definition</i>], page 89))		[Reader Method]
<code>(setf owner)</code> ((<i>method-definition</i> [<i>method-definition</i>], page 89))		[Writer Method]
	The generic function definition for this definition's method.	
Source	[symbol.lisp], page 20.	
Target Slot		
	[owner], page 90.	
<code>parent</code> (<i>object</i>)		[Generic Reader]
<code>(setf parent)</code> (<i>object</i>)		[Generic Writer]
Package	[net.didierverna.declt.assess], page 29.	
Methods		
<code>parent</code> ((<i>component-definition</i> [<i>component-definition</i>], page 80))		[Reader Method]
<code>(setf parent)</code> ((<i>component-definition</i> [<i>component-definition</i>], page 80))		[Writer Method]
	The parent definition for this definition's component.	
Source	[asdf.lisp], page 25.	
Target Slot		
	[parent], page 81.	
<code>private-definitions</code> (<i>object</i>)		[Generic Function]
	Return OBJECT's private definitions.	
Package	[net.didierverna.declt.assess], page 29.	
Source	[definition.lisp], page 19.	
Methods		
<code>private-definitions</code> ((<i>definition</i> [<i>package-definition</i>], page 92))		[Method]
	Return package DEFINITION's private definitions.	
Source	[package.lisp], page 24.	

- `private-definitions` (*object*) [Method]
Return OBJECT's private definitions from its definitions list. This is the default method for heterogeneous definitions lists.
- `public-definitions` (*object*) [Generic Function]
Return OBJECT's public definitions.
- Package** [net.didierverna.declt.assess], page 29.
- Source** [definition.lisp], page 19.
- Methods**
- `public-definitions` ((*definition* [*package-definition*], [Method]
page 92))
Return package DEFINITION's public definitions.
- Source** [package.lisp], page 24.
- `public-definitions` (*object*) [Method]
Return OBJECT's public definitions from its definitions list. This is the default method for heterogeneous definitions lists.
- `readers` (*object*) [Generic Reader]
(`setf readers`) (*object*) [Generic Writer]
- Package** [net.didierverna.declt.assess], page 29.
- Methods**
- `readers` ((*slot-definition* [*slot-definition*], [Reader Method]
page 97))
- (`setf readers`) ((*slot-definition* [*slot-definition*], [Writer Method]
page 97))
The list of definitions for this definition's slot readers.
- Source** [symbol.lisp], page 20.
- Target Slot**
[readers], page 98.
- `referee` (*object*) [Generic Reader]
(`setf referee`) (*object*) [Generic Writer]
- Package** [net.didierverna.declt.assess], page 29.
- Methods**
- `referee` ((*alias-definition* [*alias-definition*], [Reader Method]
page 74))
- (`setf referee`) ((*alias-definition* [Writer Method]
[alias-definition], *page 74*))
The original definition this definition aliases.
- Source** [symbol.lisp], page 20.
- Target Slot**
[referee], page 75.
- `setfp` (*object*) [Generic Reader]
- Package** [net.didierverna.declt.assess], page 29.
- Methods**

<p><code>setfp</code> (<i>(alias-definition [alias-definition], page 74)</i>)</p> <p>Whether this is a setf alias definition.</p> <p>Source [symbol.lisp], page 20.</p> <p>Target Slot [setf], page 75.</p>	[Reader Method]
<p><code>setfp</code> (<i>(funcooid-definition [funcooid-definition], page 84)</i>)</p> <p>Whether this is a setf definition.</p> <p>Source [symbol.lisp], page 20.</p> <p>Target Slot [setf], page 85.</p>	[Reader Method]
<p><code>slot</code> (<i>object</i>)</p> <p>Package [net.didierverna.declt.assess], page 29.</p> <p>Methods</p>	[Generic Reader]

<p><code>source-file</code> (<i>object</i>)</p> <p><code>(setf source-file)</code> (<i>object</i>)</p> <p>Package [net.didierverna.declt.assess], page 29.</p> <p>Methods</p>	[Generic Reader] [Generic Writer]
<p><code>source-file</code> (<i>(definition [definition], page 82)</i>)</p> <p><code>(setf source-file)</code> (<i>(definition [definition], page 82)</i>)</p> <p>The source file definition for this definition's object.</p> <p>Source [definition.lisp], page 19.</p> <p>Target Slot [source-file], page 83.</p>	[Reader Method] [Writer Method]
<p><code>specializers</code> (<i>object</i>)</p> <p><code>(setf specializers)</code> (<i>object</i>)</p> <p>Package [net.didierverna.declt.assess], page 29.</p> <p>Methods</p>	[Generic Reader] [Generic Writer]
<p><code>specializers</code> (<i>(method-definition [method-definition], page 89)</i>)</p> <p><code>(setf specializers)</code> (<i>(method-definition [method-definition], page 89)</i>)</p> <p>The specializers of this definition's method. This is a list of either class definitions (for regular specializers), or raw EQL specializers.</p> <p>Source [symbol.lisp], page 20.</p>	[Reader Method] [Writer Method]

Target Slot

[specializers], page 90.

standalone-combinator (*object*) [Generic Reader]
 (setf standalone-combinator) (*object*) [Generic Writer]

Package [net.didierverna.declt.assess], page 29.

Methods

standalone-combinator [Reader Method]
 ((*short-combination-definition*
 [*short-combination-definition*], page 96))

(setf standalone-combinator) [Writer Method]
 ((*short-combination-definition*
 [*short-combination-definition*], page 96))

The corresponding standalone combinator definition, or NIL.

This is a function or macro definition. Note that if this definition is unavailable, it means that the method combination itself cannot be used (yet).

Source [symbol.lisp], page 20.

Target Slot

[standalone-combinator], page 96.

standalone-reader (*object*) [Generic Reader]
 (setf standalone-reader) (*object*) [Generic Writer]

Package [net.didierverna.declt.assess], page 29.

Methods

standalone-reader ((*expander-definition*
 [*expander-definition*], page 83)) [Reader Method]

(setf standalone-reader) ((*expander-definition*
 [*expander-definition*], page 83)) [Writer Method]

A standalone reader definition for this definition's expander, or NIL.

If it exists, it's a definition for a function or macro with the same signature as that of the expander's access-fn. Note that the Common Lisp standard does not impose any actual relation between the setf expander and its access-fn. In fact, the access-fn may not even exist at all. However, if it does, it is very likely that it is a reader for the place updated by this setf expander.

Source [symbol.lisp], page 20.

Target Slot

[standalone-reader], page 84.

standalone-writer (*object*) [Generic Reader]
 (setf standalone-writer) (*object*) [Generic Writer]

Package [net.didierverna.declt.assess], page 29.

Methods

<p>standalone-writer ((<i>short-expander-definition</i> [<i>short-expander-definition</i>], page 96))</p> <p>(setf standalone-writer) ((<i>short-expander-definition</i> [<i>short-expander-definition</i>], page 96))</p> <p>A standalone writer definition for this definition's expander, or NIL. This is a function or macro definition. Note that if this definition is unavailable, it means that the expander itself cannot be used (yet).</p> <p>Source [symbol.lisp], page 20.</p> <p>Target Slot [standalone-writer], page 97.</p>	<p>[Reader Method]</p> <p>[Writer Method]</p>

Package [net.didierverna.declt.assess], page 29.	
Methods	
<code>used-by-list</code> ((<i>package-definition</i> [<i>package-definition</i>], page 92))	[Reader Method]
(<code>setf used-by-list</code>) ((<i>package-definition</i> [<i>package-definition</i>], page 92))	[Writer Method]
The definitions used-by-list for this definition's package.	
Source [package.lisp], page 24.	
Target Slot	
[<code>used-by-list</code>], page 93.	

- `value-type` (*definition*) [Generic Function]
 Return slot DEFINITION's value type.
- Package** [net.didierverna.declt.assess], page 29.
- Source** [symbol.lisp], page 20.
- Methods**
- `value-type` ((*definition* [Method]
 [typed-structure-slot-definition], page 102))
 Return typed structure slot DEFINITION's value type.
- `value-type` ((*definition* [clos-slot-definition], page 78)) [Method]
 Return CLOS slot DEFINITION's value type.
- `writers` (*object*) [Generic Reader]
 (`setf writers`) (*object*) [Generic Writer]
- Package** [net.didierverna.declt.assess], page 29.
- Methods**
- `writers` ((*slot-definition* [slot-definition], [Reader Method]
 page 97))
- (`setf writers`) ((*slot-definition* [slot-definition], [Writer Method]
 page 97))
 The list of definitions for this definition's slot writers.
- Source** [symbol.lisp], page 20.
- Target Slot**
 [writers], page 98.

6.1.5 Standalone methods

- `initialize-instance` *:before* ((*definition* [system-file-definition], [Method]
 page 101) &key system)
 Create and store a fake ASDF component representing the system file.
- Source** [asdf.lisp], page 25.
- `initialize-instance` *:after* ((*definition* [component-definition], [Method]
 page 80) &key)
 Compute component DEFINITION's location.
- Source** [asdf.lisp], page 25.
- `initialize-instance` *:after* ((*definition* [system-definition], page 100) [Method]
 &key)
 Extract author and maintainer contacts.
- Source** [asdf.lisp], page 25.
- `initialize-instance` *:after* ((*definition* [clos-classoid-mixin], [Method]
 page 77) &key packages pathnames)
 Compute CLOS classoid DEFINITION's slot definitions.
- Source** [symbol.lisp], page 20.

- initialize-instance** *:after* ((*definition* [*package-definition*], *page 92*) **&key**) [Method]
 Compute DEFINITION's package lists of external and internal symbols.
Source [package.lisp], page 24.
- initialize-instance** *:after* ((*definition* [*classoid-definition*], *page 76*) **&key** *packages pathnames*) [Method]
 Compute classoid DEFINITION's foreign status.
Source [symbol.lisp], page 20.
- initialize-instance** *:after* ((*definition* [*typed-structure-definition*], *page 102*) **&key** *packages pathnames*) [Method]
 Compute typed structure DEFINITION's type, element type, and slots.
Source [symbol.lisp], page 20.
- make-instance** ((*class* [*abstract-class*], *page 73*) **&rest** *initargs*) [Method]
Source [util.lisp], page 12.
- print-object** ((*report* [*report*], *page 93*) *stream*) [Method]
 Show REPORT's library name.
Source [assess.lisp], page 27.
- print-object** ((*definition* [*definition*], *page 82*) *stream*) [Method]
 Show DEFINITION's name.
Source [definition.lisp], page 19.
- validate-superclass** ((*class* *standard-class*) (*superclass* [*abstract-class*], *page 73*)) [Method]
Package sb-mop.
Source [util.lisp], page 12.
- validate-superclass** ((*class* [*abstract-class*], *page 73*) (*superclass* *standard-class*)) [Method]
Package sb-mop.
Source [util.lisp], page 12.

6.1.6 Classes

- abstract-class** [Class]
 The Abstract Class meta-class.
Package [net.didierverna.declt.setup], page 36.
Source [util.lisp], page 12.
Direct superclasses
 standard-class.
Direct methods
- [make-instance], page 73.

 - [validate-superclass], page 73.

accessor-method-definition [Class]

Abstract root class for accessor methods.

Package [net.didierverna.declt.assess], page 29.

Source [symbol.lisp], page 20.

Direct superclasses

- [accessor-mixin], page 74.
- [method-definition], page 89.

Direct subclasses

- [reader-method-definition], page 93.
- [writer-method-definition], page 103.

accessor-mixin [Class]

Mixin class for accessor definitions.

An accessor is a funcoid which reads or writes a target slot in a classoid. More specifically, these are ordinary functions for structure slots, and methods for classes or conditions slots.

Package [net.didierverna.declt.assess], page 29.

Source [symbol.lisp], page 20.

Direct subclasses

- [accessor-method-definition], page 74.
- [ordinary-accessor-definition], page 91.

Direct methods

- [document], page 131.
- [target-slot], page 71.

Direct slots

target-slot [Slot]

The target slot definition for this definition's accessor.

Initargs :target-slot

Readers [target-slot], page 71.

Writers *This slot is read-only.*

alias-definition [Class]

Abstract root class for alias definitions.

Package [net.didierverna.declt.assess], page 29.

Source [symbol.lisp], page 20.

Direct superclasses

[symbol-definition], page 99.

Direct subclasses

- [compiler-macro-alias-definition], page 79.
- [function-alias-definition], page 85.
- [macro-alias-definition], page 89.

Direct methods

- [category-name], page 125.
- [document], page 128.

- [index-command-name], page 134.
- [lambda-list], page 62.
- [name], page 65.
- [(setf referee)], page 67.
- [referee], page 67.
- [setfp], page 68.
- [source-pathname], page 137.

Direct slots

setf [Slot]
Whether this is a setf alias definition.

Package common-lisp.

Initargs :setf

Readers [setfp], page 68.

Writers *This slot is read-only.*

referee [Slot]
The original definition this definition aliases.

Readers [referee], page 67.

Writers [(setf referee)], page 67.

c-file-definition [Class]
The class of ASDF C file definitions.

Package [net.didierverna.declt.assess], page 29.

Source [asdf.lisp], page 25.

Direct superclasses

[source-file-definition], page 98.

cl-source-file.asd [Class]
A fake ASDF Lisp file component class for system files.

Package [net.didierverna.declt.assess], page 29.

Source [asdf.lisp], page 25.

Direct superclasses

cl-source-file.

Direct slots

type [Slot]
Package common-lisp.

Initform "asd"

class-definition [Class]
The class for class definitions.

Package [net.didierverna.declt.assess], page 29.

Source [symbol.lisp], page 20.

Direct superclasses

- [classoid-definition], page 76.
- [clos-classoid-mixin], page 77.

Direct methods

object [Slot]

Initargs :expander
Readers [expander], page 60.
Writers *This slot is read-only.*

setf [Slot]

Package common-lisp.
Initform t

standalone-reader [Slot]

A standalone reader definition for this definition's expander, or NIL.
 If it exists, it's a definition for a function or macro with the same signature as that of the expander's access-fn. Note that the Common Lisp standard does not impose any actual relation between the setf expander and its access-fn. In fact, the access-fn may not even exist at all. However, if it does, it is very likely that it is a reader for the place updated by this setf expander.

Readers [standalone-reader], page 69.
Writers [(setf standalone-reader)], page 69.

file-definition [Class]

The class of ASDF file definitions.
 All file definitions respond to the following public protocols, which see: - 'extension'.

Package [net.didierverna.declt.assess], page 29.
Source [asdf.lisp], page 25.

Direct superclasses
 [component-definition], page 80.

The list of definitions.	
Readers [definitions], page 53.	
Writers [(setf definitions)], page 53.	
setfable-funcoid-definition	[Class]
Abstract root class for setfable funcoids.	
These are (generic) functions and macros. A funcoid is setfable when it may be related to one or more setf expanders. There are two kinds of relation to a setf expander: 1. the funcoid's signature is the same as that of an expander's access-fn, and 2. a short form setf expander expands to it (i.e., it has this funcoid as its update-fn).	
Package [net.didierverna.declt.assess], page 29.	
Source [symbol.lisp], page 20.	
Direct superclasses	
[funcoid-definition], page 84.

Direct slots	
expander-for	[Slot]
A setf expander definition for this funcoid, or NIL.	
This is the definition of a setf expander that expands forms identical to this funcoid's signature. There can be only one. Note that the Common Lisp standard does not impose any actual relation between the setf expander and its access-fn. In fact, the access-fn may not even exist at all. However, if it does, it is very likely that it is a reader for the place updated by this setf expander.	
Readers [expander-for], page 60.	

Writers [(setf expander-for)], page 60.

expanders-to [Slot]

The list of setf expander definitions to this funcoid.

This is a list of definitions for short form setf expanders that have this funcoid as their update-fn. There might be more than one.

Readers [expanders-to], page 60.

Writers [(setf expanders-to)], page 60.

short-combination-definition [Class]

The class of short method combination definitions.

All short method combination definitions respond to the following public protocols, which see:

- ‘identity-with-one-argument’.

Package [net.didierverna.declt.assess], page 29.

Source [symbol.lisp], page 20.

Direct superclasses

[combination-definition], page 78.

- [stabilize], page 139.

Direct slots

symbol [Slot]

The symbol naming this definition.

Package common-lisp.

Initargs :symbol

Readers [definition-symbol], page 52.

Writers *This slot is read-only.*

home-package [Slot]

The home package definition for this definition's symbol.

Every definition gets a home package, even foreign ones. A home package can only be null when the definition's symbol is uninterned.

Readers [home-package], page 62.

Writers [(setf home-package)], page 62.

symbol-macro-definition [Class]

The class of symbol macro definitions.

Package [net.didierverna.declt.assess], page 29.

Source [symbol.lisp], page 20.

Direct superclasses

[varoid-definition], page 103.

Direct methods

- [category-name], page 126.
- [docstring], page 59.
- [index-command-name], page 135.
- [source-pathname], page 137.

system-definition [Class]

The class of ASDF system definitions.

All system definitions respond to the following public protocols, which see: - 'long-name',
 - 'mailto',
 - 'homepage',
 - 'source-control',
 - 'bug-tracker',
 - 'license-name'.

Package [net.didierverna.declt.assess], page 29.

Source [asdf.lisp], page 25.

Direct superclasses

[module-definition], page 90.

Direct methods

- [(setf authors)], page 48.

6.1.7 Types

`non-empty-string ()` [Type]

Package [net.didierverna.declt.setup], page 36.

Source [util.lisp], page 12.

6.2 Internals

6.2.1 Special variables

blanks [Special Variable]

A list of blank characters and their associated revealed representation. Each element in this list is of the form (#BLANK . #REPLACEMENT).

Package [net.didierverna.declt], page 36.

Source [doc.lisp], page 15.

categories [Special Variable]

The list of definition categories.

Each category is of the form (TITLE FILTER).

- TITLE (a string) serves as the section title.

- FILTER can be either a definition type (symbol), in which case definitions of that type are retained, or a predicate function of one (definition) argument, which should return T if the definition is to be retained.

Package [net.didierverna.declt], page 36.

Source [symbol.lisp], page 15.

configuration [Special Variable]

The Declt configuration settings.

This variable contains a property list of configuration options. Current options are:

- :swank-eval-in-emacs (Boolean)

See Section 4.1 of the user manual for more information.

Package [net.didierverna.declt.setup], page 36.

Source [configuration.lisp], page 11.

fragile-characters [Special Variable]

An association list of Texinfo fragile (anchor) characters. Elements are the form (CHAR . ALT) where CHAR is the fragile (anchor) character and ALT is an alternative Unicode character.

Package [net.didierverna.declt], page 36.

Source [texi.lisp], page 13.

licenses [Special Variable]

Package [net.didierverna.declt.assess], page 29.

Source [license.lisp], page 20.

section-names [Special Variable]

The numbered, unnumbered and appendix section names sorted by level.

Package [net.didierverna.declt], page 36.

Source [texi.lisp], page 13.

special-characters [Special Variable]

An association list of Texinfo special characters.

Elements are the form (CHAR . COMMAND) where CHAR is the special character and COMMAND is the name of the corresponding Texinfo alphabetic command.

Package [net.didierverna.declt], page 36.

Source [texi.lisp], page 13.

stabilized [Special Variable]

Whether the stabilization process is over.

This variable is set to NIL whenever new definitions are created during the process. Stabilization is run over and over again until nothing moves anymore.

Package [net.didierverna.declt.assess], page 29.

Source [finalize.lisp], page 27.

6.2.2 Macros

deffn ((*category name lambda-list &optional qualifiers*) **&body** *body*) [Macro]

Execute BODY as part of a @deffn {CATEGORY} {NAME} [QUALIFIERS] LAMBDA-LIST. CATEGORY, NAME, QUALIFIERS, and LAMBDA-LIST are escaped for Texinfo prior to rendering. LAMBDA-LIST should be provided by ‘safe-lambda-list’ or ‘safe-specializers’, which see. BODY should render on *standard-output*.

Package [net.didierverna.declt], page 36.

Source [texi.lisp], page 13.

defindent (*symbol indent*) [Macro]

Wrapper around ‘clindent’ to avoid quoting SYMBOL and INDENT.

Package [net.didierverna.declt.setup], page 36.

Source [readtable.lisp], page 12.

deftp ((*category name &optional lambda-list*) **&body** *body*) [Macro]

Execute BODY as part of a @deftp {CATEGORY} {NAME} [LAMBDA-LIST] environment. CATEGORY, NAME, and LAMBDA-LIST are escaped for Texinfo prior to rendering. LAMBDA-LIST should be provided by ‘safe-lambda-list’, which see. BODY should render on *standard-output*.

Package [net.didierverna.declt], page 36.

Source [texi.lisp], page 13.

defvr (*category name &body body*) [Macro]

Execute BODY as part of a @defvr {CATEGORY} {NAME} environment. CATEGORY and NAME are escaped for Texinfo prior to rendering. BODY should render on *standard-output*.

Package [net.didierverna.declt], page 36.

Source [texi.lisp], page 13.

destabilize (*definitions expression*) [Macro]

Invalidate the stabilization process by adding a new definition. EXPRESSION should evaluate to a new definition. ENDPUSH that definition to DEFINITIONS (a symbol), mark the stabilization process as dirty, and return that definition.

Package [net.didierverna.declt.assess], page 29.

Source [finalize.lisp], page 27.

item ((**&optional** *title*) **&body** *body*) [Macro]
Execute BODY as part of an @item [TITLE]. BODY should render on *standard-output*.

Package [net.didierverna.declt], page 36.

Source [texi.lisp], page 13.

itemize ((**&optional** *kind*) **&body** *body*) [Macro]
Execute BODY as part of an @itemize KIND environment. KIND should be a string designator. It defaults to @bullet. BODY should render on *standard-output*.

Package [net.didierverna.declt], page 36.

Source [texi.lisp], page 13.

multitable ((**&rest** *fractions*) **&body** *body*) [Macro]
Execute BODY as part of a @multitable @columnFRACTIONS environment. BODY should render on *standard-output*.

Package [net.didierverna.declt], page 36.

Source [texi.lisp], page 13.

render-to-string (**&body** *body*) [Macro]
Execute BODY with *standard-output* redirected to a string. Return that string.

Package [net.didierverna.declt], page 36.

Source [texi.lisp], page 13.

table ((**&optional** *kind*) **&body** *body*) [Macro]
Execute BODY as part of a @table KIND environment.
KIND should be a string designator. It defaults to @strong. BODY should render on *standard-output*.

Package [net.didierverna.declt], page 36.

Source [texi.lisp], page 13.

6.2.3 Ordinary functions

%deffn (*x category name lambda-list &optional qualifiers*) [Function]
Render a @deffn[x] {CATEGORY} {NAME} [QUALIFIERS] LAMBDA-LIST line. Rendering is done on *standard-output*. CATEGORY, NAME, QUALIFIERS, and LAMBDA-LIST are escaped for Texinfo prior to rendering. LAMBDA-LIST should be provided by ‘safe-lambda-list’ or ‘safe-specializers’, which see.

Package [net.didierverna.declt], page 36.

Source [texi.lisp], page 13.

%version (*type major minor status level name*) [Function]
Package [net.didierverna.declt.setup], page 36.

Source [version.lisp], page 12.

@anchor (*anchor*) [Function]
Render ANCHOR as an @anchor on a standalone line. ANCHOR is escaped for Texinfo prior to rendering. Rendering is done on *standard-output*.

Package [net.didierverna.declt], page 36.

Source [texi.lisp], page 13.

- @deffn** (*category name lambda-list &optional qualifiers*) [Function]
 Render a @deffn {CATEGORY} {NAME} [QUALIFIERS] LAMBDA-LIST line. Rendering is done on *standard-output*. CATEGORY, NAME, QUALIFIERS, and LAMBDA-LIST are escaped for Texinfo prior to rendering. LAMBDA-LIST should be provided by ‘safe-lambda-list’ or ‘safe-specializers’, which see.
- Package** [net.didierverna.declt], page 36.
- Source** [texi.lisp], page 13.
- @deffnx** (*category name lambda-list &optional qualifiers*) [Function]
 Render a @deffnx {CATEGORY} {NAME} [QUALIFIERS] LAMBDA-LIST line. Rendering is done on *standard-output*. CATEGORY, NAME, QUALIFIERS, and LAMBDA-LIST are escaped for Texinfo prior to rendering. LAMBDA-LIST should be provided by ‘safe-lambda-list’ or ‘safe-specializers’, which see.
- Package** [net.didierverna.declt], page 36.
- Source** [texi.lisp], page 13.
- @deftp** (*category name &optional lambda-list*) [Function]
 Render a @deftp {CATEGORY} {NAME} [LAMBDA-LIST] line on *standard-output*. CATEGORY, NAME, and LAMBDA-LIST are escaped for Texinfo prior to rendering. LAMBDA-LIST should be provided by ‘safe-lambda-list’, which see.
- Package** [net.didierverna.declt], page 36.
- Source** [texi.lisp], page 13.
- @defvr** (*category name*) [Function]
 Render a @defvr {CATEGORY} {NAME} line on *standard-output*. CATEGORY and NAME are escaped for Texinfo prior to rendering.
- Package** [net.didierverna.declt], page 36.
- Source** [texi.lisp], page 13.
- @end** (*environment*) [Function]
 Render and @end ENVIRONMENT line on *standard-output*. ENVIRONMENT should be a string designator.
- Package** [net.didierverna.declt], page 36.
- Source** [texi.lisp], page 13.
- @item** (*&optional title*) [Function]
 Render an @item [TITLE] line on *standard-output*.
- Package** [net.didierverna.declt], page 36.
- Source** [texi.lisp], page 13.
- @itemize** (*&optional kind*) [Function]
 Render an @itemize KIND line on *standard-output*. KIND should be a string designator. It defaults to @bullet.
- Package** [net.didierverna.declt], page 36.
- Source** [texi.lisp], page 13.

- @multitable** (*&rest fractions*) [Function]
 Render a @multitable @columnFRACTIONS line on *standard-output*.
Package [net.didierverna.declt], page 36.
Source [texi.lisp], page 13.
- @ref** (*anchor label*) [Function]
 Render ANCHOR as an @ref with online and printed LABEL.
 Both ANCHOR and LABEL are escaped for Texinfo prior to rendering. LABEL is rendered in teletype.
 Rendering is done on *standard-output*.
Package [net.didierverna.declt], page 36.
Source [texi.lisp], page 13.
- @table** (*&optional kind*) [Function]
 Render a @table KIND line on *standard-output*.
 KIND should be a string designator. It defaults to @strong.
Package [net.didierverna.declt], page 36.
Source [texi.lisp], page 13.
- add-categories-node** (*parent context status definitions*) [Function]
 Add the STATUS DEFINITIONS categories nodes to PARENT in CONTEXT.
Package [net.didierverna.declt], page 36.
Source [symbol.lisp], page 15.
- add-category-node** (*parent context status category definitions*) [Function]
 Add the STATUS CATEGORY node to PARENT for DEFINITIONS in CONTEXT.
Package [net.didierverna.declt], page 36.
Source [symbol.lisp], page 15.
- add-child** (*parent child*) [Function]
 Add CHILD node to PARENT node and return CHILD.
Package [net.didierverna.declt], page 36.
Source [texi.lisp], page 13.
- add-definitions-node** (*parent report context*) [Function]
 Add REPORT's definitions node to PARENT in CONTEXT.
Package [net.didierverna.declt], page 36.
Source [symbol.lisp], page 15.
- add-files-node** (*parent report context*) [Function]
 Add REPORT's files node to PARENT in CONTEXT.
Package [net.didierverna.declt], page 36.
Source [asdf.lisp], page 18.
- add-modules-node** (*parent report context*) [Function]
 Add REPORT's modules node to PARENT in CONTEXT.
Package [net.didierverna.declt], page 36.
Source [asdf.lisp], page 18.

- add-packages-node** (*parent report context*) [Function]
Add REPORT's packages node to PARENT in CONTEXT.
- Package** [net.didierverna.declt], page 36.
Source [package.lisp], page 18.
- add-systems-node** (*parent report context*) [Function]
Add REPORT's systems node to PARENT in CONTEXT.
- Package** [net.didierverna.declt], page 36.
Source [asdf.lisp], page 18.
- anchor** (*definition*) [Function]
Render DEFINITION's anchoring command on *STANDARD-OUTPUT*.
- Package** [net.didierverna.declt], page 36.
Source [doc.lisp], page 15.
- anchor-and-index** (*definition*) [Function]
Render DEFINITION's anchoring and indexing commands on *STANDARD-OUTPUT*.
- Package** [net.didierverna.declt], page 36.
Source [doc.lisp], page 15.
- anchor-name** (*definition*) [Function]
Return DEFINITION's anchor name, that is, "<UID>".
- Package** [net.didierverna.declt], page 36.
Source [doc.lisp], page 15.
- clindent** (*symbol indent*) [Function]
Send SYMBOL's INDENTation information to Emacs.
Emacs will set the 'common-lisp-indent-function property.
If INDENT is a symbol, use its indentation definition. Otherwise, INDENT is considered as an indentation definition.
- Package** [net.didierverna.declt.setup], page 36.
Source [readtable.lisp], page 12.
- components** (*module type*) [Function]
Return the list of all (sub)TYPE components found in MODULE's tree.
- Package** [net.didierverna.declt.assess], page 29.
Source [assess.lisp], page 27.
- copy-node** (*instance*) [Function]
Package [net.didierverna.declt], page 36.
Source [texi.lisp], page 13.
- current-time-string** () [Function]
Return the current time as a string.
- Package** [net.didierverna.declt], page 36.
Source [misc.lisp], page 13.

- declt-1** (*report &rest keys &key locations default-values
foreign-definitions declt-notice output-directory file-name info-name
info-category*) [Function]
- Package** [net.didierverna.declt], page 36.
- Source** [declt.lisp], page 19.
- definition-source-by-name** (*definition type*) [Function]
- Return DEFINITION's source for TYPE.
- Package** [net.didierverna.declt.assess], page 29.
- Source** [symbol.lisp], page 20.
- domesticp** (*symbol pathname packages pathnames*) [Function]
- Return T if a definition for SYMBOL originating in PATHNAME is domestic.
A definition is considered domestic under the following conditions:
- its originating PATHNAME is known (non NIL) and one of domestic PATHNAMES, - its originating PATHNAME is unknown, but the SYMBOL's home package is one of domestic PACKAGES.
- Note that a definition for a domestic symbol, but originating in a foreign source file is considered foreign.
- Package** [net.didierverna.declt.assess], page 29.
- Source** [definition.lisp], page 19.
- escape** (*string*) [Function]
- When STRING, escape it for Texinfo.
- Package** [net.didierverna.declt], page 36.
- Source** [texi.lisp], page 13.
- escape-anchor** (*string*) [Function]
- Escape STRING for use as a Texinfo anchor name.
In addition to regular escaping, periods, commas, colons, and parenthesis are replaced with alternative Unicode characters.
- Package** [net.didierverna.declt], page 36.
- Source** [texi.lisp], page 13.
- escape-label** (*string*) [Function]
- Escape STRING for use as a Texinfo anchor label.
In addition to regular escaping, colons are replaced with alternative Unicode characters.
- Package** [net.didierverna.declt], page 36.
- Source** [texi.lisp], page 13.
- escape-lambda-list** (*lambda-list*) [Function]
- Escape safe LAMBDA-LIST for Texinfo.
This function expects a value from 'safe-lambda-list', which see. It returns a string properly escaped for Texinfo, apart from &-constructs which retain their original form, and @ref's and @t's which are already properly set.
- Package** [net.didierverna.declt], page 36.
- Source** [texi.lisp], page 13.

- file-components** (*module*) [Function]
Return the list of all file components found in MODULE's tree.
- Package** [net.didierverna.declt.assess], page 29.
- Source** [assess.lisp], page 27.
- file-node** (*definition context*) [Function]
Create and return a file DEFINITION node in CONTEXT.
- Package** [net.didierverna.declt], page 36.
- Source** [asdf.lisp], page 18.
- finalize** (*definitions packages pathnames*) [Function]
Finalize DEFINITIONS in domestic PACKAGES and PATHNAMES. For more information, see 'stabilize' and 'freeze'.
- Package** [net.didierverna.declt.assess], page 29.
- Source** [finalize.lisp], page 27.
- find-definition** (*object definitions*) [Function]
Find a definition for OBJECT in DEFINITIONS.
- Package** [net.didierverna.declt.assess], page 29.
- Source** [definition.lisp], page 19.
- first-word-length** (*string*) [Function]
Return the length of the first word in STRING. Initial whitespace characters are skipped.
- Package** [net.didierverna.declt], page 36.
- Source** [texi.lisp], page 13.
- freeze** (*definitions*) [Function]
Freeze DEFINITIONS.
Currently, this means:
- computing the definitions UIDs,
 - potentially upgrading generic definitions to reader or writer definitions.
- Package** [net.didierverna.declt.assess], page 29.
- Source** [finalize.lisp], page 27.
- funcoid-name** (*funcoid*) [Function]
Return FUNCOID's name, or NIL.
FUNCOID may be a function, a macro function, or a compiler macro function. Lambda expression are not considered as proper names, so NIL is returned.
- Package** [net.didierverna.declt.assess], page 29.
- Source** [assess.lisp], page 27.
- i-reader** (*stream subchar arg*) [Function]
Construct a call to 'defindent' by reading an argument list from STREAM. This dispatch macro character function is installed on #i in the NET.DIDIERVERNA.DECLT named readtable.
- Package** [net.didierverna.declt.setup], page 36.
- Source** [readtable.lisp], page 12.

- index** (*definition*) [Function]
 Render DEFINITION's indexing command on *STANDARD-OUTPUT*.
Package [net.didierverna.declt], page 36.
Source [doc.lisp], page 15.
- itemize-list** (*list &key renderer kind format key*) [Function]
 Render a LIST of items as part of an @itemize KIND environment.
 KIND should be a string designator. It defaults to @bullet.
 If RENDERER is non-nil, it must be a function of one argument (every LIST element) that performs the rendering on *standard-output* directly.

 Otherwise, the rendering is done by calling format, as explained below. - FORMAT is the format string to use for every LIST element. It defaults to "~A".
 - KEY is a function of one argument (every LIST element) used to provide the necessary arguments to the FORMAT string. If multiple arguments are needed, they should be returned by KEY as multiple values.
Package [net.didierverna.declt], page 36.
Source [texi.lisp], page 13.
- load-system** (*system-name*) [Function]
 Load ASDF SYSTEM-NAME in a manner suitable to extract documentation. Return the corresponding ASDF system.
 SYSTEM-NAME is an ASDF system designator.
Package [net.didierverna.declt.assess], page 29.
Source [assess.lisp], page 27.
- long-title** (*definition*) [Function]
 Return a long title for DEFINITION.
 It is of the form "The <qualified safe name> <type name>".
Package [net.didierverna.declt], page 36.
Source [doc.lisp], page 15.
- make-all-file-definitions** (*definitions*) [Function]
 Return a list of all file definitions for system DEFINITIONS.
Package [net.didierverna.declt.assess], page 29.
Source [assess.lisp], page 27.
- make-all-module-definitions** (*definitions*) [Function]
 Return a list of all module definitions for system DEFINITIONS.
Package [net.didierverna.declt.assess], page 29.
Source [assess.lisp], page 27.
- make-all-package-definitions** (*file-definitions system-definitions*) [Function]
 Return a list of all package definitions for FILE- and SYSTEM-DEFINITIONS. This list contains definitions for packages defined in the corresponding files, or for which the source is not found, but the name is of the form SYSTEM/... (case insensitive) for one of the corresponding systems.
Package [net.didierverna.declt.assess], page 29.
Source [assess.lisp], page 27.

- make-all-symbol-definitions** (*packages pathnames all-symbols-p*) [Function]
 Return a list of all domestic symbol definitions.
 If ALL-SYMBOLS-P, introspect all accessible symbols in the current Lisp environment. Otherwise (the default), limit introspection to the symbols from domestic PACKAGES. Domesticity is defined in relation to domestic PACKAGES and PATHNAMES; see ‘domesticp’.
- Package** [net.didierverna.declt.assess], page 29.
Source [assess.lisp], page 27.
- make-all-system-definitions** (*system*) [Function]
 Return a list of all system definitions for SYSTEM.
 The only guarantee is that the definition for SYSTEM comes first. The other considered systems are those found recursively in SYSTEM’s dependencies, and located under SYSTEM’s directory.
 See ‘subsystems’ for more information.
- Package** [net.didierverna.declt.assess], page 29.
Source [assess.lisp], page 27.
- make-classoid-definition** (*symbol classoid packages pathnames*) [Function]
 Make a new CLASSOID definition for SYMBOL.
 Also create all slots definitions. The foreign status of the new classoid and its slots is computed from domestic PACKAGES and PATHNAMES.
 The concrete class of the new definition (structure, class, or condition) depends on the kind of CLASSOID.
- Package** [net.didierverna.declt.assess], page 29.
Source [symbol.lisp], page 20.
- make-clos-slot-definition** (*slot &optional foreign*) [Function]
 Make a new CLOS SLOT definition, possibly FOREIGN.
- Package** [net.didierverna.declt.assess], page 29.
Source [symbol.lisp], page 20.
- make-combination-definition** (*symbol combination &optional foreign*) [Function]
 Make a new method COMBINATION definition for SYMBOL, possibly FOREIGN. The concrete class of the new definition depends on the COMBINATION type.
- Package** [net.didierverna.declt.assess], page 29.
Source [symbol.lisp], page 20.
- make-compiler-macro-alias-definition** (*symbol &optional setf*) [Function]
 Make a new compiler macro alias definition for (possibly SETF) SYMBOL.
- Package** [net.didierverna.declt.assess], page 29.
Source [symbol.lisp], page 20.
- make-compiler-macro-definition** (*symbol compiler-macro &rest keys &key setf foreign*) [Function]
 Make a new COMPILER-MACRO definition for SYMBOL.
- Package** [net.didierverna.declt.assess], page 29.
Source [symbol.lisp], page 20.

- make-constant-definition** (*symbol*) [Function]
 Make a new constant definition for SYMBOL.
- Package** [net.didierverna.declt.assess], page 29.
Source [symbol.lisp], page 20.
- make-context** (**&rest** *keys* **&key** *locations default-values foreign-definitions declt-notice*) [Function]
 Make a new rendering context.
 The following keys are available.
 - LOCATIONS: whether to hyperlink definitions to their locations. Currently supported values are NIL (the default), and :file-system. - DEFAULT-VALUES: whether to render default / standard values. Defaults to NIL.
 - FOREIGN-DEFINITIONS: whether to render foreign definitions. Defaults to NIL.
 - DECLT-NOTICE: whether to add a small credit paragraph to Declt. Possible values are NIL, :short, or :long (the default).
- Package** [net.didierverna.declt], page 36.
Source [doc.lisp], page 15.
- make-expander-definition** (*symbol expander &optional foreign*) [Function]
 Make a new setf EXPANDER definition for SYMBOL, possibly foreign.
- Package** [net.didierverna.declt.assess], page 29.
Source [symbol.lisp], page 20.
- make-file-definition** (*file &optional foreign*) [Function]
 Make a new FILE definition.
 The concrete class of the new definition depends on the kind of FILE.
- Package** [net.didierverna.declt.assess], page 29.
Source [asdf.lisp], page 25.
- make-function-alias-definition** (*symbol &optional setf*) [Function]
 make a new function alias definition for (possibly SETF) SYMBOL.
- Package** [net.didierverna.declt.assess], page 29.
Source [symbol.lisp], page 20.
- make-generic-function-definition** (*symbol generic &rest keys &key setf foreign*) [Function]
 Make a new GENERIC function definition for (SETF) SYMBOL, possibly FOREIGN.
- Package** [net.didierverna.declt.assess], page 29.
Source [symbol.lisp], page 20.
- make-macro-alias-definition** (*symbol*) [Function]
 Make a new macro alias definition for SYMBOL.
- Package** [net.didierverna.declt.assess], page 29.
Source [symbol.lisp], page 20.
- make-macro-definition** (*symbol macro &optional foreign*) [Function]
 Make a new MACRO definition for SYMBOL.
- Package** [net.didierverna.declt.assess], page 29.
Source [symbol.lisp], page 20.

- make-method-definition** (*method &optional foreign*) [Function]
 Make a new METHOD definition, possibly FOREIGN.
- Package** [net.didierverna.declt.assess], page 29.
- Source** [symbol.lisp], page 20.
- make-module-definition** (*module &optional foreign*) [Function]
 Make a new MODULE definition.
- Package** [net.didierverna.declt.assess], page 29.
- Source** [asdf.lisp], page 25.
- make-node** (*&key name synopsis section-type section-name next previous up children before-menu-contents after-menu-contents*) [Function]
 Make a new node definition.
- Package** [net.didierverna.declt], page 36.
- Source** [texi.lisp], page 13.
- make-ordinary-function-definition** (*symbol function &rest keys &key setf foreign*) [Function]
 Make a new ordinary FUNCTION definition for (SETF) SYMBOL, possibly FOREIGN.
- Package** [net.didierverna.declt.assess], page 29.
- Source** [symbol.lisp], page 20.
- make-package-definition** (*package &optional foreign*) [Function]
 Make a new PACKAGE definition, possibly FOREIGN.
- Package** [net.didierverna.declt.assess], page 29.
- Source** [package.lisp], page 24.
- make-report** () [Function]
 Make a new report.
- Package** [net.didierverna.declt.assess], page 29.
- Source** [assess.lisp], page 27.
- make-special-definition** (*symbol*) [Function]
 Make a new special variable definition for SYMBOL.
- Package** [net.didierverna.declt.assess], page 29.
- Source** [symbol.lisp], page 20.
- make-symbol-definitions** (*symbol packages pathnames*) [Function]
 Make and return a list of all existing domestic definitions for SYMBOL. Domesticity is defined in relation to domestic PACKAGES and PATHNAMES; see ‘domesticp’.
- Package** [net.didierverna.declt.assess], page 29.
- Source** [assess.lisp], page 27.
- make-symbol-macro-definition** (*symbol*) [Function]
 Make a new symbol macro definition for SYMBOL.
- Package** [net.didierverna.declt.assess], page 29.
- Source** [symbol.lisp], page 20.

- make-system-definition** (*system* **&optional** *foreign*) [Function]
 Make a new SYSTEM definition.
- Package** [net.didierverna.declt.assess], page 29.
- Source** [asdf.lisp], page 25.
- make-system-file-definition** (*system*) [Function]
 Make a new system file definition for SYSTEM.
- Package** [net.didierverna.declt.assess], page 29.
- Source** [asdf.lisp], page 25.
- make-system-file-definitions** (*systems*) [Function]
 Make a list of system file definitions for SYSTEMS.
 Multiple systems may be defined in the same file. There is however only one definition for each file.
- Package** [net.didierverna.declt.assess], page 29.
- Source** [asdf.lisp], page 25.
- make-type-definition** (*symbol expander*) [Function]
 Make a new type definition for SYMBOL.
- Package** [net.didierverna.declt.assess], page 29.
- Source** [symbol.lisp], page 20.
- make-typed-structure-slot-definition** (*slot* **&optional** *foreign*) [Function]
 Make a new typed structure SLOT definition, possibly FOREIGN.
- Package** [net.didierverna.declt.assess], page 29.
- Source** [symbol.lisp], page 20.
- merge-expander-p** (*definition expander*) [Function]
 Return T if function DEFINITION and setf EXPANDER can be documented jointly.
- Package** [net.didierverna.declt], page 36.
- Source** [symbol.lisp], page 15.
- merge-generic-writer** (*reader writer*) [Function]
 Check if WRITER generic definition can be documented jointly with READER. If so, return the generalized Boolean value of ‘merge-methods’, which see.
- Merging is only attempted on generic functions defined exclusively via slot :accessor keywords. For merging to actually occur, there must not exist any property specific to only one definition, or different between the two (no related expander information, same method combination, same docstring, etc.). The only exception is their lambda lists.
- The same conditions apply to methods, which definitions are also merged. Only unqualified methods must exist. Standalone reader and writer methods are still permitted.
- Package** [net.didierverna.declt], page 36.
- Source** [symbol.lisp], page 15.

- merge-methods** (*reader writer*) [Function]
 Attempt to merge READER and WRITER generic definitions methods. See ‘merge-generic-writer’ for the exact conditions under which merging may occur. If merging is possible, return a list of three values:
 1. a list of the form ((READER-METHOD . WRITER-METHOD) ...) for associated reader and writer methods,
 2. a list of standalone readers,
 3. a list of standalone writers,
 Otherwise, return NIL.
Package [net.didierverna.declt], page 36.
Source [symbol.lisp], page 15.
- merge-ordinary-writer** (*reader writer*) [Function]
 Return WRITER if it can be documented jointly with READER.
Package [net.didierverna.declt], page 36.
Source [symbol.lisp], page 15.
- method-name** (*method*) [Function]
 Return METHOD’s canonical name.
 Return a second value of T if METHOD is in fact a SETF one.
Package [net.didierverna.declt.assess], page 29.
Source [symbol.lisp], page 20.
- module-components** (*module*) [Function]
 Return the list of all module components found in MODULE’s tree.
Package [net.didierverna.declt.assess], page 29.
Source [assess.lisp], page 27.
- new-funcoid-definition** (*name packages pathnames*) [Function]
 Return a new macro or function definition for NAME, or NIL. PACKAGES and PATHNAMES are used to determine domesticity.
Package [net.didierverna.declt.assess], page 29.
Source [finalize.lisp], page 27.
- new-generic-definition** (*generic packages pathnames*) [Function]
 Make a new foreign GENERIC function definition. PACKAGES and PATHNAMES are used to determine domesticity.
Package [net.didierverna.declt.assess], page 29.
Source [finalize.lisp], page 27.
- node-after-menu-contents** (*instance*) [Reader]
 (setf node-after-menu-contents) (*instance*) [Writer]
Package [net.didierverna.declt], page 36.
Source [texi.lisp], page 13.
Target Slot
 [after-menu-contents], page 141.

node-before-menu-contents (<i>instance</i>)	[Reader]
(setf node-before-menu-contents) (<i>instance</i>)	[Writer]
Package [net.didierverna.declt], page 36.	
Source [texi.lisp], page 13.	
Target Slot

Source [texi.lisp], page 13.	
Target Slot	
[section-name], page 141.	

- `node-section-type` (*instance*) [Reader]
 (`setf node-section-type`) (*instance*) [Writer]
Package [net.didierverna.declt], page 36.
Source [texi.lisp], page 13.
Target Slot
 [section-type], page 141.
- `node-synopsis` (*instance*) [Reader]
 (`setf node-synopsis`) (*instance*) [Writer]
Package [net.didierverna.declt], page 36.
Source [texi.lisp], page 13.
Target Slot
 [synopsis], page 140.
- `node-up` (*instance*) [Reader]
 (`setf node-up`) (*instance*) [Writer]
Package [net.didierverna.declt], page 36.
Source [texi.lisp], page 13.
Target Slot
 [up], page 141.
- `one-liner-p` (*string*) [Function]
 Return T if STRING is non empty and does not span multiple lines.
Package [net.didierverna.declt.assess], page 29.
Source [util.lisp], page 19.
- `package-external-symbols` (*package*) [Function]
 Return the list of PACKAGE's external symbols.
Package [net.didierverna.declt.assess], page 29.
Source [package.lisp], page 24.
- `package-internal-symbols` (*package*) [Function]
 Return the lists of PACKAGE's internal and external symbols as two values.
Package [net.didierverna.declt.assess], page 29.
Source [package.lisp], page 24.
- `package-symbols` (*package*) [Function]
 Return the list of symbols from home PACKAGE.
Package [net.didierverna.declt.assess], page 29.
Source [assess.lisp], page 27.
- `parse-contact(s)` (*contact(s)*) [Function]
 Parse CONTACT(S) as either a contact string, or a list of such. Return a list of parsed contacts. See 'parse-contact-string' for more information.
Package [net.didierverna.declt.assess], page 29.
Source [util.lisp], page 19.

- parse-contact-string** (*string*) [Function]
 Parse STRING of the form "My Name <my@address>".
 Both name and address are optional. If only an address is provided, the angle brackets may be omitted.
 If neither a name nor an address can be extracted, return NIL. Otherwise, return the list ("My Name" . "my@address"). In such a case, either the CAR or the CDR may be null, but not both.
Package [net.didierverna.declt.assess], page 29.
Source [util.lisp], page 19.
- read-next-line** (*stream*) [Function]
 Read one line from STREAM.
 Return a list of two values:
 - the line itself, or STREAM,
 - whether a newline character is missing at the end of the line.
Package [net.didierverna.declt], page 36.
Source [texi.lisp], page 13.
- reference** (*definition context &optional short punctuation*) [Function]
 Render a possibly SHORT DEFINITION's reference in CONTEXT.
 Rendering is done on *STANDARD-OUTPUT*.
 When DEFINITION is foreign and CONTEXT disables their rendering, the produced reference is just text. Otherwise, an actual link is created.
 Unless SHORT, the DEFINITION type is advertised after the reference itself. When SHORT, the reference is followed by a PUNCTUATION character (a dot by default) or NIL.
Package [net.didierverna.declt], page 36.
Source [doc.lisp], page 15.
- release-status-number** (*release-status*) [Function]
Package [net.didierverna.declt.setup], page 36.
Source [version.lisp], page 12.
- render-definition-core** (*definition context*) [Function]
 Render DEFINITION's documentation core in CONTEXT.
 More specifically, render DEFINITION's package and source file references.
Package [net.didierverna.declt], page 36.
Source [symbol.lisp], page 15.
- render-dependencies** (*dependencies context &optional prefix*) [Function]
 Render COMPONENT's DEPENDENCIES in CONTEXT, optionally PREFIXing the title.
Package [net.didierverna.declt], page 36.
Source [asdf.lisp], page 18.
- render-dependency** (*dependency context*) [Function]
 Render a resolved DEPENDENCY specification in CONTEXT. See 'resolve-dependency-specification' for more information.
Package [net.didierverna.declt], page 36.
Source [asdf.lisp], page 18.

- render-docstring** (*item*) [Function]
 Render ITEM's documentation string. Rendering is done on **standard-output**.
Package [net.didierverna.declt], page 36.
Source [doc.lisp], page 15.
- render-header** (*report file-name info-name info-category declt-notice current-time-string*) [Function]
 Render the header of the Texinfo file.
Package [net.didierverna.declt], page 36.
Source [declt.lisp], page 19.
- render-headline** (*definition*) [Function]
 Render a headline for DEFINITION. Also anchor and index it.
Package [net.didierverna.declt], page 36.
Source [symbol.lisp], page 15.
- render-node** (*node level*) [Function]
 Render NODE at LEVEL and all its children at LEVEL+1.
Package [net.didierverna.declt], page 36.
Source [texi.lisp], page 13.
- render-package-reference** (*definition context &optional force*) [Function]
 Render a reference to DEFINITION's home package definition in CONTEXT. When FORCE, render a reference to the Common Lisp package, even if CONTEXT says otherwise. Possibly render an "uninterned" mention instead of an actual reference, when there is no home package to reference.
Package [net.didierverna.declt], page 36.
Source [symbol.lisp], page 15.
- render-references** (*title definitions context &optional short*) [Function]
 Render an enTITLED list of [SHORT] references to DEFINITIONS in CONTEXT. See 'reference' for the meaning of SHORT. The list is rendered in an itemized table item, unless there is only one definition in which case it appears directly as the table item's contents. Rendering is done on **standard-output**.
Package [net.didierverna.declt], page 36.
Source [doc.lisp], page 15.
- render-text** (*text*) [Function]
 Render TEXT for Texinfo.
 Rendering is done on **standard-output**.
 The rendering takes care of escaping the text for Texinfo, and attempts to embellish the output by detecting potential paragraphs from standalone lines.
Package [net.didierverna.declt], page 36.
Source [texi.lisp], page 13.
- render-top-node** (*node*) [Function]
 Render the whole nodes hierarchy starting at toplevel NODE.
Package [net.didierverna.declt], page 36.
Source [texi.lisp], page 13.

reorder-dependency-def (*dependency-def*) [Function]

Reorder information in DEPENDENCY-DEF so that the system is always first. More specifically:

- simple component names are returned as-is,
- :version expressions are returned as (system :version version-specifier), - :feature expressions are returned as (... :feature feature-expression), - :require expressions are returned as (system :require).

Note that because a feature expression is defined recursively, the first element in the reordered list may be another reordered sub-list rather than a simple component name directly. In any case, the system name will always be in the deepest first position.

Package [net.didierverna.declt.assess], page 29.

Source [util.lisp], page 19.

reordered-dependency-def-system (*reordered-dependency-def*) [Function]

Extract the system name from REORDERED-DEPENDENCY-DEF. See ‘reorder-dependency-def’ for more information.

Package [net.didierverna.declt.assess], page 29.

Source [util.lisp], page 19.

resolve-dependency-specification (*specification component definitions foreign*) [Function]

Resolve dependency SPECIFICATION for (FOREIGN) COMPONENT in DEFINITIONS. SPECIFICATION must already be reordered (see ‘reorder-dependency-def’ for more information). The specification’s component name is replaced with its corresponding definition. A foreign definition may be created in the process.

If such a definition is neither found, nor created, return NIL. Otherwise, return a list of the updated specification (suitable to MAPCAN).

Package [net.didierverna.declt.assess], page 29.

Source [finalize.lisp], page 27.

reveal (*string*) [Function]

Return a copy of STRING with blanks revealed.

If STRING is empty or null, use the empty set symbol. Otherwise, each blank character is replaced with a visible Unicode representation. See ‘*blanks*’ for more information.

Package [net.didierverna.declt], page 36.

Source [doc.lisp], page 15.

safe-lambda-list (*lambda-list &optional safe-specializers*) [Function]

Return a safe LAMBDA-LIST, suitable to pass to Texinfo.

The original lambda-list’s structure is preserved, but all symbols are converted to revealed strings, and initform / supplied-p data is removed. &whole, &environment, and &aux parts are removed as they don’t provide any information on the funcoid’s usage. SAFE-SPECIALIZERS is provided for method LAMBDA-LISTS. See ‘safe-specializers’ for more information. Mandatory arguments associated with a non-nil safe specializer are listed together.

Package [net.didierverna.declt], page 36.

Source [symbol.lisp], page 15.

- safe-specializers** (*definition context*) [Function]
 Return a list of safe specializers for method DEFINITION in CONTEXT.
 A safe specializer is the printed form of either a reference to a class definition, or an EQL specializer's type name.
- Unless the CONTEXT specifies otherwise, T specializers are replaced by NIL to indicate that they are not to be advertized.
- For setf and writer definitions, only the specializers rest is used, as these methods get the new value as their first argument.
- Package** [net.didierverna.declt], page 36.
Source [symbol.lisp], page 15.
- select-keys** (*keys &rest selected*) [Function]
 Return a new property list from KEYS with only SELECTED ones.
- Package** [net.didierverna.declt], page 36.
Source [declt.lisp], page 19.
- source-by-name** (*name type*) [Function]
 Return source pathname for NAMED object of TYPE.
- Package** [net.didierverna.declt.assess], page 29.
Source [util.lisp], page 19.
- source-by-object** (*object*) [Function]
 Return OBJECT's source pathname.
- Package** [net.didierverna.declt.assess], page 29.
Source [util.lisp], page 19.
- stabilize-clos-classoid-slot** (*definition definitions packages pathnames*) [Function]
 Compute CLOS classoid slot DEFINITION's reader and writer definitions. This function is used for regular class and condition slots.
- Package** [net.didierverna.declt.assess], page 29.
Source [finalize.lisp], page 27.
- stabilize-clos-structure-slot** (*definition definitions packages pathnames*) [Function]
 Compute CLOS structure slot DEFINITION's reader and writer definitions.
- Package** [net.didierverna.declt.assess], page 29.
Source [finalize.lisp], page 27.
- sub-component-p** (*component directory*) [Function]
 Return T if COMPONENT can be found under DIRECTORY.
- Package** [net.didierverna.declt.assess], page 29.
Source [assess.lisp], page 27.

- subsystem** (*name system directory*) [Function]
 Return NAME'd SYSTEM dependency if found under DIRECTORY, or nil.
Package [net.didierverna.declt.assess], page 29.
Source [assess.lisp], page 27.
- subsystems** (*system directory*) [Function]
 Return the list of SYSTEM and all its dependencies found under DIRECTORY. All dependencies are descended recursively. Both :defsystem-depends-on and :depends-on are included. Potential duplicates are removed.
Package [net.didierverna.declt.assess], page 29.
Source [assess.lisp], page 27.
- system-dependencies** (*system*) [Function]
 Return all system names from SYSTEM dependencies. This includes both :defsystem-depends-on and :depends-on.
Package [net.didierverna.declt.assess], page 29.
Source [assess.lisp], page 27.
- validate-email** (*string*) [Function]
 Check that STRING is of the form nonblank@nonblank, after trimming. Return that string, or issue a warning and return NIL.
Package [net.didierverna.declt.assess], page 29.
Source [util.lisp], page 19.

6.2.4 Generic functions

- category-name** (*definition*) [Generic Function]
 Return DEFINITION's category name.
Package [net.didierverna.declt], page 36.
Source [doc.lisp], page 15.
Methods
- category-name** ((*definition* [*system-definition*], *page 100*)) [Method]
 Return "system"
Source [asdf.lisp], page 18.
- category-name** ((*definition* [*module-definition*], *page 90*)) [Method]
 Return "module"
Source [asdf.lisp], page 18.
- category-name** ((*definition* [*file-definition*], *page 84*)) [Method]
 Return "file"
Source [asdf.lisp], page 18.
- category-name** ((*definition* [*package-definition*], *page 92*)) [Method]
 Return "package".
Source [package.lisp], page 18.

- `category-name` ((*definition* [*alias-definition*], page 74)) [Method]
Return the category name of alias DEFINITION's referee.
Source [symbol.lisp], page 15.
- `category-name` ((*definition* [*slot-definition*], page 97)) [Method]
Return "slot".
Source [symbol.lisp], page 15.
- `category-name` ((*definition* [*class-definition*], page 75)) [Method]
Return "class".
Source [symbol.lisp], page 15.
- `category-name` ((*definition* [*condition-definition*],
page 81)) [Method]
Return "condition".
Source [symbol.lisp], page 15.
- `category-name` ((*definition* [*structure-definition*],
page 98)) [Method]
Return "structure".
Source [symbol.lisp], page 15.
- `category-name` ((*definition* [*writer-method-definition*],
page 103)) [Method]
Return "writer method".
Source [symbol.lisp], page 15.
- `category-name` ((*definition* [*reader-method-definition*],
page 93)) [Method]
Return "reader method".
Source [symbol.lisp], page 15.
- `category-name` ((*definition* [*method-definition*], page 89)) [Method]
Return "method".
Source [symbol.lisp], page 15.
- `category-name` ((*definition* [*combination-definition*],
page 78)) [Method]
Return "method combination".
Source [symbol.lisp], page 15.
- `category-name` ((*definition* [*generic-writer-definition*],
page 87)) [Method]
Return "generic writer".
Source [symbol.lisp], page 15.
- `category-name` ((*definition* [*generic-reader-definition*],
page 87)) [Method]
Return "generic reader".
Source [symbol.lisp], page 15.

- `category-name` ((*definition* [generic-function-definition], page 86)) [Method]
 Return "generic function".
Source [symbol.lisp], page 15.
- `category-name` ((*definition* [ordinary-writer-definition], page 91)) [Method]
 Return "writer".
Source [symbol.lisp], page 15.
- `category-name` ((*definition* [ordinary-reader-definition], page 91)) [Method]
 Return "reader".
Source [symbol.lisp], page 15.
- `category-name` ((*definition* [ordinary-function-definition], page 91)) [Method]
 Return "function".
Source [symbol.lisp], page 15.
- `category-name` ((*expander* [expander-definition], page 83)) [Method]
 Return "setf expander".
Source [symbol.lisp], page 15.
- `category-name` ((*definition* [type-definition], page 101)) [Method]
 Return "type".
Source [symbol.lisp], page 15.
- `category-name` ((*definition* [compiler-macro-definition], page 79)) [Method]
 Return "compiler macro".
Source [symbol.lisp], page 15.
- `category-name` ((*definition* [macro-definition], page 89)) [Method]
 Return "macro".
Source [symbol.lisp], page 15.
- `category-name` ((*definition* [symbol-macro-definition], page 100)) [Method]
 Return "symbol macro".
Source [symbol.lisp], page 15.
- `category-name` ((*definition* [special-definition], page 98)) [Method]
 Return "special variable".
Source [symbol.lisp], page 15.
- `category-name` ((*definition* [constant-definition], page 82)) [Method]
 Return "constant".
Source [symbol.lisp], page 15.

- `declt-notice` (*object*) [Generic Reader]
- Package** [net.didierverna.declt], page 36.
- Methods**
- `declt-notice` ((*context* [*context*], page 141)) [Reader Method]
 whether to add a small credit paragraph about Declt. Possible values are NIL, :short, or :long (the default).
- Source** [doc.lisp], page 15.
- Target Slot**
 [declt-notice], page 142.
- `default-values` (*object*) [Generic Reader]
- Package** [net.didierverna.declt], page 36.
- Methods**
- `default-values` ((*context* [*context*], page 141)) [Reader Method]
 Whether to render default / standard values.
- Source** [doc.lisp], page 15.
- Target Slot**
 [default-values], page 142.
- `document` (*definition context &key inline writer merged-methods merge-expander &allow-other-keys*) [Generic Function]
 Render DEFINITION's documentation in CONTEXT.
- Package** [net.didierverna.declt], page 36.
- Source** [doc.lisp], page 15.
- Method Combination**
 [document], page 140.
- Methods**
- `document :open` ((*definition* [*system-definition*], page 100) [*context* &*key*]) [Method]
 Render DEFINITION's system-specific bits in CONTEXT.
- Source** [asdf.lisp], page 18.
- `document :close` ((*definition* [*module-definition*], page 90) [*context* &*key*]) [Method]
 Render module DEFINITION's references in CONTEXT.
- Source** [asdf.lisp], page 18.
- `document :close` ((*definition* [*lisp-file-definition*], page 88) [*context* &*key*]) [Method]
 Render lisp file DEFINITION's references in CONTEXT.
- Source** [asdf.lisp], page 18.
- `document` ((*definition* [*component-definition*], page 80) [*context* &*key*]) [Method]
 Render ASDF component DEFINITION's documentation in CONTEXT.
- Source** [asdf.lisp], page 18.

- `document :around ((definition [component-definition], [Method]
page 80) context &key)`
Anchor, index and document component DEFINITION in CONTEXT. Documentation is done in a @table environment.
Source [asdf.lisp], page 18.
- `document ((definition [package-definition], page 92) [Method]
context &key)`
Render package DEFINITION's documentation in context.
Source [package.lisp], page 18.
- `document ((definition [alias-definition], page 74) context [Method]
&key)`
Render alias DEFINITION's documentation in CONTEXT.
Source [symbol.lisp], page 15.
- `document ((definition [typed-structure-slot-definition], page 102) context [Method]
&key)`
Render typed structure slot DEFINITION's documentation in CONTEXT. More specifically, render DEFINITION's reader and writer references.
Source [symbol.lisp], page 15.
- `document ((definition [clos-slot-definition], page 78) [Method]
context &key)`
Render CLOS slot DEFINITION's documentation in CONTEXT. More specifically, render DEFINITION's reader and writer references.
Source [symbol.lisp], page 15.
- `document ((definition [slot-definition], page 97) context [Method]
&key)`
Render slot DEFINITION's documentation in context. More specifically, render DEFINITION's value type, and for CLOS slots render allocation, initform, and initargs.
Source [symbol.lisp], page 15.
- `document ((definition [typed-structure-definition], [Method]
page 102) context &key)`
Render typed structure DEFINITION's type documentation in CONTEXT.
Source [symbol.lisp], page 15.
- `document ((definition [clos-classoid-mixin], page 77) [Method]
context &key)`
Render CLOS classoid mixin DEFINITION's documentation in CONTEXT. More specifically, render DEFINITION's direct superclasses, subclasses, methods, and initargs references.
Source [symbol.lisp], page 15.
- `document :close ((definition [classoid-definition], [Method]
page 76) context &key)`
Close classoid DEFINITION's documentation environment in CONTEXT. More specifically:

- close the @table environment,
- close the @deftp environment.

Source [symbol.lisp], page 15.

document ((*definition* [*classoid-definition*], page 76) [Method]
context &key)

Render classoid DEFINITION's direct slots references in CONTEXT.

Source [symbol.lisp], page 15.

document :open ((*definition* [*classoid-definition*], [Method]
 page 76) *context &key*)

Open classoid DEFINITION's documentation environment in CONTEXT.
 More specifically:

- open a @deftp environment,
- anchor and index DEFINITION,
- render DEFINITION's docstring,
- open a @table environment,
- render DEFINITIONS's core documentation.

Source [symbol.lisp], page 15.

document :open ((*definition* [*method-definition*], page 89) [Method]
context &key inline writer)

Open method DEFINITION's documentation in CONTEXT.

More specifically:

- open a @deffn environment, possibly merging a WRITER method,
- anchor and index DEFINITION,
- render DEFINITION's docstring,
- open a @table environment,
- render DEFINITION's source file.

When INLINE, the method definition is documented within its owner's documentation. In such a case, the package reference is not rendered (as it is the same as the owner's), and the source file is only referenced if different from that of the owner's.

Source [symbol.lisp], page 15.

document ((*definition* [*short-combination-definition*], [Method]
 page 96) *context &key*)

Render short method combination DEFINITION's documentation in CONTEXT.

Source [symbol.lisp], page 15.

document ((*definition* [*combination-definition*], page 78) [Method]
context &key)

Render method combination DEFINITION's client references in CONTEXT.

Source [symbol.lisp], page 15.

document :around ((*definition* [Method]
 [*generic-writer-definition*], page 87) *context &key*)

Prevent generic writer DEFINITION from being documented when merging.

Source [symbol.lisp], page 15.

- `document :around ((definition [Method]
[generic-reader-definition], page 87) context &rest args
&key)`
Check for potential writer merging with generic reader DEFINITION.
Source [symbol.lisp], page 15.
- `document :close ((definition [Method]
[generic-function-definition], page 86) context &key
merged-methods)`
Close generic function DEFINITION's documentation.
More specifically:
- render DEFINITION's method references, possibly merging readers and
writers, - close the @table environment,
- close the @defn environment.
Source [symbol.lisp], page 15.
- `document ((definition [generic-function-definition], [Method]
page 86) context &key)`
Render generic function DEFINITION's combination reference in CONTEXT.
Source [symbol.lisp], page 15.
- `document :around ((definition [Method]
[ordinary-writer-definition], page 91) context &key)`
Prevent ordinary writer DEFINITION from being documented when merging.
Source [symbol.lisp], page 15.
- `document :around ((definition [Method]
[ordinary-reader-definition], page 91) context &rest args
&key)`
Check for potential writer merging with ordinary reader DEFINITION.
Source [symbol.lisp], page 15.
- `document ((definition [short-expander-definition], [Method]
page 96) context &key)`
Render short expander DEFINITION's standalone writer reference in CON-
TEXT.
Source [symbol.lisp], page 15.
- `document ((definition [expander-definition], page 83) [Method]
context &key)`
Render setf expander DEFINITION's standalone reader reference in CON-
TEXT.
Source [symbol.lisp], page 15.
- `document :around ((definition [Method]
[long-expander-definition], page 88) context &key)`
Prevent long expander DEFINITION from being documented when merging.
Source [symbol.lisp], page 15.

- document** *:close* ((*definition* [*type-definition*], *page 101*) context &**key**) [Method]
 Close type DEFINITION's documentation environment in CONTEXT. More specifically:
 - close the @table environment,
 - close the @deftp environment.
Source [symbol.lisp], page 15.
- document** *:open* ((*definition* [*type-definition*], *page 101*) context &**key**) [Method]
 Open type DEFINITION's documentation environment in CONTEXT. More specifically:
 - open a @deftp environment,
 - anchor and index DEFINITION,
 - render DEFINITION's docstring,
 - open a @table environment,
 - render DEFINITION's core.
Source [symbol.lisp], page 15.
- document** ((*definition* [*accessor-mixin*], *page 74*) context &**key**) [Method]
 Render accessor mixin DEFINITION's target slot reference in CONTEXT.
Source [symbol.lisp], page 15.
- document** ((*definition* [*setfable-funcoid-definition*], *page 95*) context &**key** *merge-expander*) [Method]
 Render setfable funcoid DEFINITION's expanders information in CONTEXT. More specifically:
 - render a reference to a set expander for DEFINITION, unless the definitions are merged,
 - render references to all setf expanders expanding to DEFINITION.
Source [symbol.lisp], page 15.
- document** *:open* ((*definition* [*setfable-funcoid-definition*], *page 95*) context &**key** *merge-expander* *writer*) [Method]
 Open setfable funcoid DEFINITION's documentation environment in CONTEXT. More specifically:
 - open a @deffn environment, possibly merging a related setf expander or writer,
 - anchor and index DEFINITION,
 - render DEFINITION's docstring,
 - open a @table environment,
 - render DEFINITION's core documentation.
Source [symbol.lisp], page 15.
- document** *:around* ((*definition* [*setfable-funcoid-definition*], *page 95*) context &**rest** **args** &**key**) [Method]
 Check for potential expander merging of setfable funcoid DEFINITION.
Source [symbol.lisp], page 15.

document *:close* ((*definition* [*funcoid-definition*], *page 84*) [Method]
context **&key**)

Close funcoid DEFINITION's documentation environment in CONTEXT.
 More specifically:

- close the @table environment,
- close the @deffn environment.

Source [symbol.lisp], page 15.

document *:open* ((*definition* [*funcoid-definition*], *page 84*) [Method]
context **&key**)

Open funcoid DEFINITION's documentation environment in CONTEXT.
 More specifically:

- open a @deffn environment,
- anchor and index DEFINITION,
- render DEFINITION's docstring,
- open a @table environment,
- render DEFINITION's core documentation.

This is the default method.

Source [symbol.lisp], page 15.

document *:close* ((*definition* [*varoid-definition*], *page 103*) [Method]
context **&key**)

Close varoid DEFINITION's documentation environment in CONTEXT.
 More specifically:

- close the @table environment,
- close the @defvr environment.

Source [symbol.lisp], page 15.

document ((*definition* [*varoid-definition*], *page 103*) [Method]
context **&key**)

Render varoid DEFINITION's documentation in CONTEXT.

More specifically, render DEFINITION's package and source file references.
 As a special exception, slots don't reference their package, unless it differs
 from the slot's owner package, and never reference their source file, which is
 the same as their owner.

Source [symbol.lisp], page 15.

document *:open* ((*definition* [*varoid-definition*], *page 103*) [Method]
context **&key**)

Open varoid DEFINITIONS's documentation environment in CONTEXT.
 More specifically:

- open a @defvr environment,
- anchor and index DEFINITION,
- render DEFINITION's docstring,
- open a @table environment.

Source [symbol.lisp], page 15.

document *:around* (*definition context* **&key**) [Method]

Check whether to render foreign DEFINITIONS.

external-symbols (*object*) [Generic Reader]

(setf external-symbols) (*object*) [Generic Writer]

Package [net.didierverna.declt.assess], page 29.

Methods

`external-symbols` ((*package-definition* [Reader Method]
 [*package-definition*], page 92))

(`setf external-symbols`) ((*package-definition* [Writer Method]
 [*package-definition*], page 92))

The list of corresponding external symbols.

Source [package.lisp], page 24.

Target Slot

[external-symbols], page 93.

`foreign-definitions` (*object*) [Generic Reader]

Package [net.didierverna.declt], page 36.

Methods

`foreign-definitions` ((*context* [context], [Reader Method]
 page 141))

Whether to render foreign definitions.

Source [doc.lisp], page 15.

Target Slot

[foreign-definitions], page 142.

`index-command-name` (*definition*) [Generic Function]

Return DEFINITION's index command name.

Package [net.didierverna.declt], page 36.

Source [doc.lisp], page 15.

Methods

`index-command-name` ((*definition* [system-definition], [Method]
 page 100))

Return "systemindex"

Source [asdf.lisp], page 18.

`index-command-name` ((*definition* [module-definition], [Method]
 page 90))

Return "moduleindex"

Source [asdf.lisp], page 18.

`index-command-name` ((*definition* [file-definition], [Method]
 page 84))

Return "fileindex"

Source [asdf.lisp], page 18.

`index-command-name` ((*definition* [package-definition], [Method]
 page 92))

Return "packageindex".

Source [package.lisp], page 18.

- `index-command-name` ((*definition* [*alias-definition*], [Method]
page 74))
 Return the index command name of alias DEFINITION's referee.
Source [symbol.lisp], page 15.
- `index-command-name` ((*definition* [*slot-definition*], [Method]
page 97))
 Return "slotsubindex".
Source [symbol.lisp], page 15.
- `index-command-name` ((*definition* [*class-definition*], [Method]
page 75))
 Return "classsubindex".
Source [symbol.lisp], page 15.
- `index-command-name` ((*definition* [*condition-definition*], [Method]
page 81))
 Return "conditionsubindex".
Source [symbol.lisp], page 15.
- `index-command-name` ((*definition* [*structure-definition*], [Method]
page 98))
 Return "structuresubindex".
Source [symbol.lisp], page 15.
- `index-command-name` ((*definition* [*method-definition*], [Method]
page 89))
 Return "methodsubindex".
Source [symbol.lisp], page 15.
- `index-command-name` ((*definition* [*combination-definition*], [Method]
page 78))
 Return "combinationsubindex".
Source [symbol.lisp], page 15.
- `index-command-name` ((*definition* [*generic-function-definition*], [Method]
page 86))
 Return "genericsubindex".
Source [symbol.lisp], page 15.
- `index-command-name` ((*definition* [*ordinary-function-definition*], [Method]
page 91))
 Return "functionsubindex".
Source [symbol.lisp], page 15.
- `index-command-name` ((*expander* [*expander-definition*], [Method]
page 83))
 Return "expandersubindex".
Source [symbol.lisp], page 15.

- `index-command-name` ((*definition* [*type-definition*], [Method]
page 101)
 Return "typesubindex".
Source [symbol.lisp], page 15.
- `index-command-name` ((*definition* [Method]
 [*compiler-macro-definition*], *page 79*)
 Return "compilermacrosindex".
Source [symbol.lisp], page 15.
- `index-command-name` ((*definition* [Method]
 [*macro-definition*], *page 89*)
 Return "macrosindex".
Source [symbol.lisp], page 15.
- `index-command-name` ((*definition* [Method]
 [*symbol-macro-definition*], *page 100*)
 Return "symbolmacrosindex".
Source [symbol.lisp], page 15.
- `index-command-name` ((*definition* [Method]
 [*special-definition*], *page 98*)
 Return "specialsubindex".
Source [symbol.lisp], page 15.
- `index-command-name` ((*definition* [Method]
 [*constant-definition*], *page 82*)
 Return "constantsubindex".
Source [symbol.lisp], page 15.
- `internal-symbols` (*object*) [Generic Reader]
 (`setf internal-symbols`) (*object*) [Generic Writer]
Package [net.didierverna.declt.assess], page 29.
Methods
- `internal-symbols` ((*package-definition* [Reader Method]
 [*package-definition*], *page 92*)
 (`setf internal-symbols`) ((*package-definition* [Writer Method]
 [*package-definition*], *page 92*)
 The list of corresponding internal symbols.
Source [package.lisp], page 24.
Target Slot
 [internal-symbols], page 93.
- `locations` (*object*) [Generic Reader]
Package [net.didierverna.declt], page 36.
Methods

`locations` ((*context* [*context*], page 141)) [Reader Method]

Whether to hyperlink definitions to their locations.

Currently supported values are NIL (the default), and `:file-system`.

Source [doc.lisp], page 15.

Target Slot

[locations], page 142.

`safe-name` (*definition* &optional *qualified*) [Generic Function]

Return DEFINITION's safe name, possibly QUALIFIED.

Safe names have blank characters replaced with visible Unicode symbols. See 'reveal' for more information.

Package [net.didierverna.declt], page 36.

Source [doc.lisp], page 15.

Methods

`safe-name :around` ((*definition* [*file-definition*], page 84) [Method]
&optional *qualify*)

Append DEFINITION's file extension at the end, when applicable.

Source [asdf.lisp], page 18.

`safe-name` ((*definition* [*component-definition*], page 80) [Method]
&optional *qualified*)

Reveal component DEFINITION's name, possibly QUALIFIED.

A QUALIFIED component's name is of the form "path/to/component", each element being the name of a component's parent.

Source [asdf.lisp], page 18.

`safe-name :around` ((*definition* [*slot-definition*], page 97) [Method]
&optional *qualified*)

When QUALIFIED, prepend slot DEFINITION's classoid safe name.

Source [symbol.lisp], page 15.

`safe-name :around` ((*definition* [*method-definition*], [Method]
page 89) &optional *qualified*)

When QUALIFIED, append method DEFINITION's qualifiers and specializers.

Source [symbol.lisp], page 15.

`safe-name` ((*definition* [*symbol-definition*], page 99) [Method]
&optional *qualified*)

Reveal symbol DEFINITION's name, possibly QUALIFIED.

A QUALIFIED name is of the form "package:[:]symbol", maybe in a setf list. Uninterned symbols are denoted by the \emptyset package.

Source [symbol.lisp], page 15.

`safe-name` ((*definition* [*definition*], page 82) &optional [Method]
qualified)

Reveal unqualifiable DEFINITION's name. This is the default method.

- `source-pathname` (*definition*) [Generic Function]
 Return DEFINITION's source pathname.
- Package** [net.didierverna.declt.assess], page 29.
- Source** [definition.lisp], page 19.
- Methods**
- `source-pathname` ((*definition* [*component-definition*], [Method]
page 80))
 Return component DEFINITION's source pathname.
 This actually is the corresponding system's source file.
Source [asdf.lisp], page 25.
- `source-pathname` ((*definition* [*alias-definition*], [Method]
page 74))
 Return NIL.
 Aliases are defined dynamically so it's impossible to locate the code being
 executed.
Source [symbol.lisp], page 20.
- `source-pathname` ((*definition* [*slot-definition*], *page 97*) [Method]
 Return slot DEFINITION's owner source pathname.
Source [symbol.lisp], page 20.
- `source-pathname` ((*definition* [*combination-definition*], [Method]
page 78))
 Return method combination DEFINITION's source pathname.
Source [symbol.lisp], page 20.
- `source-pathname` ((*definition* [*expander-definition*], [Method]
page 83))
 Return setf expander DEFINITION's source pathname.
Source [symbol.lisp], page 20.
- `source-pathname` ((*definition* [*type-definition*], [Method]
page 101))
 Return type DEFINITION's source pathname.
Source [symbol.lisp], page 20.
- `source-pathname` ((*definition* [*symbol-macro-definition*], [Method]
page 100))
 Return symbol macro DEFINITION's source pathname.
Source [symbol.lisp], page 20.
- `source-pathname` ((*definition* [*special-definition*], [Method]
page 98))
 Return special DEFINITION's source pathname.
Source [symbol.lisp], page 20.

`source-pathname` ((*definition* [*constant-definition*], [Method]
page 82))

Return constant DEFINITION's source pathname.

Source [symbol.lisp], page 20.

`source-pathname` (*definition*) [Method]

Return DEFINITION's object source pathname (this is the default method).

`stabilize` (*definition definitions packages pathnames*) [Generic Function]

Stabilize DEFINITION in DEFINITIONS and domestic PACKAGES and PATHNAMES.

Package [net.didierverna.declt.assess], page 29.

Source [finalize.lisp], page 27.

Method Combination

progn.

Options :most-specific-first

Methods

`stabilize progn` ((*definition* [*system-definition*], [Method]
page 100) *definitions packages pathnames*)

Compute system DEFINITION's defsystem dependency definitions. Those definitions are guaranteed to be in the original system's order.

`stabilize progn` ((*definition* [*module-definition*], [Method]
page 90) *definitions packages pathnames*)

Compute module DEFINITION's child definitions.

Those definitions are guaranteed to be in the module's original order.

`stabilize progn` ((*definition* [*lisp-file-definition*], [Method]
page 88) *definitions packages pathnames*)

Compute Lisp file DEFINITION's definitions list.

`stabilize progn` ((*definition* [*component-definition*], [Method]
page 80) *definitions packages pathnames*)

Compute component DEFINITION's parent and dependency definitions. Those definitions are guaranteed to be in the original component's order.

`stabilize progn` ((*definition* [*package-definition*], [Method]
page 92) *definitions packages pathnames*)

Compute package DEFINITION's use, used-by, and definitions lists. New foreign package definitions may be created and added at the end of DEFINITIONS in the process.

`stabilize progn` ((*definition* [*function-alias-definition*], [Method]
page 85) *definitions packages pathnames*)

Compute simple function alias DEFINITION's referee.

`stabilize progn` ((*definition* [*compiler-macro-alias-definition*], [Method]
page 79) *definitions packages pathnames*)

Compute compiler macro alias DEFINITION's referee.

- `stabilize progn` ((*definition* [`macro-alias-definition`], [Method]
page 89) *definitions packages pathnames*)
Compute macro alias DEFINITION's referee.
- `stabilize progn` ((*definition* [typed-structure-slot-definition], [Method]
page 102) *definitions packages pathnames*)
Compute typed structure slot DEFINITION's reader and writer definitions.
- `stabilize progn` ((*definition* [`clos-slot-definition`], [Method]
page 78) *definitions packages pathnames*)
Compute CLOS slot DEFINITION's reader and writer definitions.
- `stabilize progn` ((*definition* [`clos-classoid-mixin`], [Method]
page 77) *definitions packages pathnames*)
Compute classoid DEFINITION's super/sub classoids, and method definitions.
- `stabilize progn` ((*definition* [`method-definition`], [Method]
page 89) *definitions packages pathnames*)
Compute method DEFINITION's owner, and specializer references.
- `stabilize progn` ((*definition* [short-combination-definition], [Method]
page 96) *definitions packages pathnames*)
Compute short combination DEFINITION's standalone combinator definition.
- `stabilize progn` ((*definition* [combination-definition], [Method]
page 78) *definitions packages pathnames*)
Compute method combination DEFINITION's users.
- `stabilize progn` ((*definition* [generic-function-definition], [Method]
page 86) *definitions packages pathnames*)
Compute generic function DEFINITION's methods, and combination definition.
- `stabilize progn` ((*definition* [short-expander-definition], [Method]
page 96) *definitions packages pathnames*)
Compute short setf expander DEFINITION's standalone writer definition.
- `stabilize progn` ((*definition* [expander-definition], [Method]
page 83) *definitions packages pathnames*)
Compute setf expander DEFINITION's standalone reader definition.
- `stabilize progn` ((*definition* [setfable-funcooid-definition], [Method]
page 95) *definitions packages pathnames*)
Compute DEFINITION's expander-for and expanders-to references.
- `stabilize progn` ((*definition* [`symbol-definition`], [Method]
page 99) *definitions packages pathnames*)
Compute symbol DEFINITION's home package definition.
New foreign package definitions may be created and added at the end of DEFINITIONS in the process.

`stabilize progn ((definition [definition], page 82) [Method]
 definitions packages pathnames)`
 Compute DEFINITION's source file definition.

6.2.5 Method combinations

`document ()` [Method Combination]

The documentation protocol's method combination.

This method combination provides the following four method groups:

- around methods (optional, :around qualifier),
- opening methods (optional, :open qualifier),
- body methods (no qualifier),
- closing methods (optional, :close qualifier).

Around methods behave like those of the standard method combination, except that they are ordered most specific last. They can be used to conditionalize the actual rendering of documentation, for example in order to filter out definitions that are merged with others.

The main methods block behaves as follows.

- The most specific opening method, if any, is executed.
- All body methods (if any) are executed sequentially in most specific last order.
- Finally, the most specific closing method, if any, is executed.

No method group requires the existence of an applicable method, but for each generic call, there must of course be at least one applicable method, regardless of the group.

Package [net.didierverna.declt], page 36.

Source [doc.lisp], page 15.

Client Functions

[document], page 127.

6.2.6 Structures

`node` [Structure]

The NODE structure.

This structure holds Texinfo nodes.

Package [net.didierverna.declt], page 36.

Source [texi.lisp], page 13.

Direct superclasses

structure-object.

Direct slots

`name` [Slot]

Package [net.didierverna.declt.assess], page 29.

Readers [node-name], page 118.

Writers [(setf node-name)], page 118.

`synopsis` [Slot]

Readers [node-synopsis], page 119.

Writers [(setf node-synopsis)], page 119.

<code>section-type</code>	[Slot]
Initform : <code>numbered</code>	
Readers [<code>node-section-type</code>], page 119.	
Writers [(<code>setf node-section-type</code>)], page 119.	
<code>section-name</code>	[Slot]
Readers [<code>node-section-name</code>], page 118.	
Writers [(<code>setf node-section-name</code>)], page 118.	
<code>next</code>	[Slot]
Readers [<code>node-next</code>], page 118.	
Writers [(<code>setf node-next</code>)], page 118.	
<code>previous</code>	[Slot]
Readers [<code>node-previous</code>], page 118.	
Writers [(<code>setf node-previous</code>)], page 118.	
<code>up</code>	[Slot]
Readers [<code>node-up</code>], page 119.	
Writers [(<code>setf node-up</code>)], page 119.	
<code>children</code>	[Slot]
Package [<code>net.didierverna.declt.assess</code>], page 29.	
Readers [<code>node-children</code>], page 118.	
Writers [(<code>setf node-children</code>)], page 118.	
<code>before-menu-contents</code>	[Slot]
Readers [<code>node-before-menu-contents</code>], page 118.	
Writers [(<code>setf node-before-menu-contents</code>)], page 118.	
<code>after-menu-contents</code>	[Slot]
Readers [<code>node-after-menu-contents</code>], page 117.	
Writers [(<code>setf node-after-menu-contents</code>)], page 117.	

6.2.7 Classes

<code>context</code>	[Class]
The class of rendering contexts.	
Package [<code>net.didierverna.declt</code>], page 36.	
Source [<code>doc.lisp</code>], page 15.	
Direct methods	
• [<code>declt-notice</code>], page 127.	
• [<code>default-values</code>], page 127.	
• [<code>foreign-definitions</code>], page 133.	
• [<code>locations</code>], page 136.	

Direct slots

locations	[Slot]
Whether to hyperlink definitions to their locations. Currently supported values are NIL (the default), and :file-system.	
Initargs	:locations
Readers	[locations], page 136.
Writers	<i>This slot is read-only.</i>
default-values	[Slot]
Whether to render default / standard values.	
Initargs	:default-values
Readers	[default-values], page 127.
Writers	<i>This slot is read-only.</i>
foreign-definitions	[Slot]
Whether to render foreign definitions.	
Initargs	:foreign-definitions
Readers	[foreign-definitions], page 133.
Writers	<i>This slot is read-only.</i>
declt-notice	[Slot]
whether to add a small credit paragraph about Declt. Possible values are NIL, :short, or :long (the default).	
Initform	:long
Initargs	:declt-notice
Readers	[declt-notice], page 127.
Writers	<i>This slot is read-only.</i>
